Contents

vii	<i>Conference Committee</i>
ix	<i>Introduction</i>

ADVANCED VEHICLE TECHNOLOGY I

3	Advanced vehicle technologies G. R. Lane, U.S. Army Tank-Automotive Command
12	Advanced vehicle technologies modeling, simulation, and demonstration K. Pradeep, U.S. Army Tank-Automotive Command
21	Hybrid electric drive active suspension HMMWV V. Nestico, U.S. Army Tank-Automotive and Armaments Command
25	Active suspension technology for combat vehicles F. B. Hoogterp, U.S. Army Tank-Automotive Command
49	Collision avoidance safety technology: the least bang for the buck P. J. Lescoe, U.S. Army Tank-Automotive Command

ADVANCED VEHICLE TECHNOLOGY II

57	Robotic convoy J. Jaczkowski, U.S. Army Tank-Automotive and Armaments Command
69	Intravehicular digitization and digital vehicular architecture C. Ostrowski, U.S. Army Tank-Automotive Command
79	Combined arms command and control (CAC2): advanced technology demonstration (ATD) W. Duncan, U.S. Army Communications-Electronics Command
86	Single-channel ground airborne radio system (SINCGARS) based remote control for the M1 Abrahms J. R. Urda, U.S. Army Tank-Automotive Research, Development, and Engineering Ctr.

INFORMATION SCIENCES FOR DIGITIZING THE BATTLEFIELD

97	Integration challenges for rotorcraft on the digital battlefield T. A. DuBois, Boeing Defense & Space Group
113	Battlefield digitization and the medium lift assault helicopter D. T. Hayes, Boeing Helicopter Co. Technologies for Advanced Land Combat: A Critical Review, edited by Emily H. Vandiver, Gerald R. Lane, Thomas A. DuBois, Proc. of SPIE Vol. 10281 (Vol. CR59), 1028101 © (1995) 2017 SPIE · CCC code: 0277-786X/17/\$18 · doi: 10.1117/12.2285067

RAPID FORCE PROJECTION INITIATIVE

- 131 **U.S. Army Rapid Force Projection Initiative (RFPI)**
E. H. Vandiver, U.S. Army Missile Command
- 143 **Role of demonstration in the Rapid Force Projection Initiative: model, test, model philosophy**
R. A. Gallman, U.S. Army Missile Command
- 155 **Role of simulation in the design of the Rapid Force Projection Initiative (RFPI) early version demonstration (EVD)**
G. Tackett, U.S. Army Missile Command
- 165 **U.S. Army Missile Command (MICOM) support to the Rapid Force Projection Initiative and army land combat**
W. C. McCorkle, U.S. Army Missile Command
- 175 **U.S. Army Communications-Electronics Command technology efforts for the Rapid Force Projection Initiative**
W. B. Morrow, Jr., U.S. Army Communications-Electronics Command

21ST CENTURY LAND WARRIOR

- 191 **Integrated sight modules: fire control technology for the 21st century**
L. T. Marshall, M. Weaver, W. Thodos, B. W. Schilling, U.S. Army Communications-Electronics Command Directorate

Conference Committee

Conference Chairs

Gerald R. Lane, U.S. Army
Tank-Automotive Command
Thomas A. DuBois, Boeing Defense & Space Group
Emily H. Vandiver, U.S. Army Missile Command

Session Chairs

- 1 Advanced Vehicle Technology I
 Gerald R. Lane, U.S. Army
 Tank-Automotive Command
- 2 Advanced Vehicle Technology II
 Gerald R. Lane, U.S. Army
 Tank-Automotive Command
- 3 Information Sciences for Digitizing the Battlefield
 Thomas A. DuBois, Boeing Defense & Space Group
- 4 Rapid Force Projection Initiative
 Emily H. Vandiver, U.S. Army Missile Command
- 5 21st Century Land Warrior
 Carol Fitzgerald, Office of the Deputy Secretary
 (Research & Tech.)

TECHNOLOGIES FOR ADVANCED LAND COMBAT

INTRODUCTION

It is a pleasure to introduce this collection of papers presented at the Critical Review of Technologies for Advanced Land Combat, held 17 - 18 April 1995, in Orlando, Florida. This review is as timely as the technologies presented herein, as the U.S. science and technology community is called to address the challenges of the digital battlefield for the year 2000. The most recent guidance from the U.S. Army Training and Doctrine Command (TRADOC) emphasizes the need for U.S. forces to be lethal, survivable, and increasingly capable against threats which have evolved from the historic "single enemy" to today's multiplicity of global trouble spots.

The overarching document describing the Army operational concept for the next century, "Force XXI Operations" (TRADOC Pamphlet 525-5, 1 Aug 1994,) describes the conceptual foundations for the conduct of future operations in war and in military operations other than war (MOOTW). The Army, as defined in this concept, includes the active Army, Army Reserve, Army National Guard, and Department of the Army civilians. These U.S. forces are increasingly called upon to respond to "non-traditional" functions including peacekeeping and other MOOTW. The challenge associated with MOOTW is to ensure that U.S. forces remain the best equipped, most capable in the world, while ready to meet any challenge.

This collection of papers discusses future requirements for advanced land combat. The papers identify emerging technologies which are poised to address these requirements, and describe activities designed to show the combat worth, or value added, of these capabilities when applied to U.S. land forces. The proposed applications are hosted on various platforms ranging from unmanned ground vehicles to manned rotary wing aircraft. Recurring themes include advances in battle command (i.e., command and control systems), situational awareness, active control, and data fusion.

The program areas participating in this Critical Review provide technology solutions across a broad base of applications for mounted and dismounted forces. The objectives of the Advanced Vehicle Technologies program are to lighten and digitize future armored / mounted forces.

x / Introduction

These vehicular technologies and simulations combine both inter- and intravehicle digitization and communications while focusing on the Army's Force XXI goals.

The Rapid Force Projection Initiative (RFPI) Advanced Concept Technology Demonstration, one of nine Advanced Concept Technology Demonstrations approved by the Office of the Secretary of Defense (OSD), integrates and demonstrates advanced technology solutions for the U.S. early entry forces. National defense strategy requires that the United States possess highly lethal, rapidly deployable forces which can conduct operations immediately upon arrival. The situations encountered during the early phases of Operation Desert Storm illustrate the potential vulnerabilities of our light forces when deployed against an armored or mechanized threat. In general, these forces deploy on tactical transport aircraft with minimal organic fire support. In response to this challenge, RFPI technologies must meet these constraints while providing increased survivability, lethality, target acquisition, and improved command tempo for early entry task forces.

Advanced simulation and modeling methods are viewed as enabling technologies. Advanced techniques, including the application of Distributed Interactive Simulation (DIS), are used throughout the programs reviewed to multiply the effect of analysis and demonstration in a cost effective and reconfigurable manner. The application of early simulation during the conduct of these programs results in significant savings of resources while providing opportunities for developer and user community feedback early in the technology development process. Many of the technologies are also applicable to dual use and commercial-off-the-shelf applications, thereby providing opportunities for the rapid dissemination of defense technologies for application to non-defense related problems.

We gratefully acknowledge the time and effort offered by each of the authors and presenters, and appreciate the assistance provided by the SPIE staff in the organization of this Critical Review. We anticipate that the collected papers in this volume will provide a valuable tool for Critical Review participants as our nation faces the challenges of the twenty-first century.
