Front Matter: Volume 10297

, "Front Matter: Volume 10297," Proc. SPIE 10297, Matching the Energy Source to the Clinical Need: A Critical Review, 1029701 (24 January 2000); doi: 10.1117/12.2284434

Event: Digital Optical Computing, 1990, Los Angeles, United States

Contents

- ix *Conference Committee*
- xi *Preface*

THERMAL RESHAPING I

- 3 **Overview of lasers in dermatology**
K. M. Kelly, J. S. Nelson, Beckman Laser Institute and Medical Clinic
- 24 **Advances in thermal modification of joint capsular and musculoskeletal collagenous tissue**
K. Hayashi, M. D. Markel, Univ. of Wisconsin/Madison
- 51 **Thermal techniques for reshaping the cornea**
B. S. Trembly, Dartmouth College

THERMAL TREATMENT OF BENIGN DISEASE

- 83 **New energy sources for catheter ablation**
P. J. Wang, M. K. Homoud, M. S. Link, N. A. M. Estes III, New England Medical Ctr./Tufts Univ. School of Medicine
- 99 **Transmyocardial revascularization: the magic of drilling holes in the heart**
R. M. Verdaasdonk, Univ. Medical Ctr. Utrecht (Netherlands)

THERMAL TREATMENT OF MALIGNANT DISEASE I

- 139 **Therapeutic implications of heat-induced lung injury**
J. B. Putnam, Jr., S. L. Thomsen, M. Siegenthaler, Univ. of Texas M.D. Anderson Cancer Ctr.
- 161 **Minimally invasive therapies in the treatment of bone malignancies**
D. E. Dupuy, Brown Univ. School of Medicine
- 172 **Minimally invasive thermal brain treatment**
P. R. Morrison, Harvard Medical Laser Ctr./Harvard Medical School;
T. Z. Wong, Duke Univ. Medical Ctr.

THERMAL RESHAPING II

- 195 **Historical perspectives on procedures to ligate the fallopian tube for sterilization**
T. P. Ryan, Ethicon, Inc.
- 231 **Blood vessel architectural features and their effect on thermal phenomena**
J. A. Pearce, S. L. Thomsen, Univ. of Texas/Austin

THERMAL TREATMENT OF MALIGNANT DISEASE II

- 281 **Minimally invasive therapy of primary breast cancer**
D. S. Robinson, St. Luke's Hospital of Kansas City
- 294 **Overview of thermal ablation therapy for focal hepatic neoplasms**
S. N. Goldberg, Beth Israel Deaconess Medical Ctr./Harvard Medical School
- 327 **Thermal therapy techniques for skin and superficial tissue disease**
P. R. Stauffer, Univ. of California/San Francisco

THERMAL TREATMENT AND IMAGING I

- 371 **Using endometrial ablation as a treatment for abnormal bleeding: energy source comparisons and clinical results**
T. P. Ryan, Ethicon, Inc.
- 403 **Magnetic resonance techniques for real-time assessment of thermal treatment**
T. V. Samulski, Duke Univ. Medical Ctr.

THERMAL TREATMENT DIAGNOSTICS

- 425 **Qualitative and quantitative pathology of clinically relevant thermal lesions**
S. L. Thomsen, Univ. of Texas/Austin
- 460 **Ultrasonic techniques for assessment of temperature and thermal damage**
E. S. Ebbini, Univ. of Minnesota/Twin Cities
- 485 **Electromagnetic methods for thermal therapy monitoring and assessment**
K. D. Paulson, A. Hartov, P. M. Meaney, Dartmouth College

THERMAL TREATMENT AND IMAGING II

- 519 **Evaluation and comparison of five experimental BPH/prostate cancer treatment modalities**
P. J. Hoopes, Dartmouth Medical School and Dartmouth College;
K. A. Wishnow, Beth Israel Deaconess Medical Ctr./Harvard Medical School;
L. R. Bartholomew, Dartmouth Medical School; E. Jonsson, Reykjavik Hospital (Iceland); J. C. Williams, Univ. of Florida/Jacksonville;
K. L. Moodie, Dartmouth Medical School; T. Z. Wong, Duke Univ. Medical Ctr.; R. D. Harris, Dartmouth Medical School; T. P. Ryan, Ethicon, Inc.;
B. S. Trembly, Dartmouth College; T. A. McNicholas, Lister Hospital (UK);
J. A. Heany, Dartmouth Medical School
- 546 **Prostate thermal therapy: technologies and treatment strategies**
C. J. Diedrich, W. H. Nau, Univ. of California/San Francisco

Conference Committee

Conference Chair

Thomas P. Ryan, Ethicon, Inc.

Session Chairs

- 1 Thermal Reshaping I
Sharon L. Thomsen, M.D., University of Texas/Austin
- 2 Thermal Treatment of Benign Disease
Chris J. Diedrich, University of California/San Francisco
- 3 Thermal Treatment of Malignant Disease I
S. Nahum Goldberg, M.D., Beth Israel Deaconess Medical Center/Harvard Medical School
- 4 Thermal Reshaping II
Terence Z. Wong, M.D., Duke University Medical Center
- 5 Thermal Treatment of Malignant Disease II
P. Jack Hoopes, D.V.M., Dartmouth Medical School
- 6 Thermal Treatment and Imaging I
Emad S. Ebbini, University of Minnesota/Twin Cities
- 7 Thermal Treatment Diagnostics
Thomas P. Ryan, Ethicon, Inc.
- 8 Thermal Treatment and Imaging II
David S. Robinson, M.D., St. Luke's Hospital of Kansas City

Preface

The objective of this conference is twofold. First, we gather physicians, surgeons, engineers, physicists, and other scientists who are skilled in thermal therapy and the means to deliver and evaluate it. Each presenter is an expert in his or her field and is actively researching thermal therapy projects. Second, we strive to organize the human body by organ site and give comprehensive coverage to thermal treatment. This coverage includes anatomy, physiology, malignant and benign diseases, and conditions as a background, then it progresses to controlled energy delivery utilizing laser, microwave, ultrasound, radiofrequency, and other modalities. Many treatments involve minimally invasive techniques and can be performed in the office.

The conference covers the following sites and disease states: liver, brain, lung, fallopian tubes, superficial cancers, heart, prostate (BPH), eye, skin, shoulder and knee, uterus, prostate (cancer), blood vessels, and breast. Technologies to image tissue with electromagnetic methods are included, as well as magnetic resonance and ultrasound methods to assess temperature. Lastly, tissue damage assessment, both acute and long-term, are covered.

By gathering presenters including surgeons, radiologists, along with other scientists, the technologies and techniques will be presented by hands-on experts, leading to a cross-fertilization among medical specialties. Many of the papers in the proceedings cover a century of human effort to conquer a condition or disease state. Early efforts sometimes used burning red-hot poker or dc pulses to cause tissue eradication, often monitored by a stethoscope held to the abdomen to hear popping and sizzling. The presentations will show the continued progress and development toward a level of sophistication that current techniques have achieved, often under computer guidance. With improvements and the wide availability of imaging modalities, image guidance and improved target-tissue localization are leading to more precise and safer energy delivery.

As we begin the new millennium and end the old one, it is time to reflect on technology and how it is applied to improve the human condition. Presently, thermal therapy is being used more and more to treat cancer, reshape collagen for vision correction, treat BPH in the office, and enable percutaneous treatment with image guidance, all the while offering alternatives to surgical resection. By transitioning to therapy in a minimally invasive environment, large surgical procedures under general anesthesia are avoided. In addition, finite element modeling is allowing instrument design and energy delivery in a more rapid development process, especially in the design and monitoring of thermal delivery.

Current devices on the market are treating BPH for urination difficulties, upper palate and tongue for snoring and sleep apnea resolution, spine treatment for painful disc herniation, nonsurgical tubal ligation for female sterilization, endometrial ablation with a balloon for abnormal menstrual bleeding, capsule shrinkage for shoulder instability, tissue vaporization for arthroscopic knee and shoulder procedures, and breast cancer treatment without lumpectomy or mastectomy. Some of these procedures provide an alternative to otherwise untreatable conditions. Sealing of blood vessels by thermal techniques is also one of the examples of surgical applications of energy delivery. Other devices are placed percutaneously, then expand like a Christmas tree with protruding needles in an array to provide heat treatment to a large volume. These are specially suited to people who are poor surgical candidates.

The proceedings of this conference are indisputably greater than the sum of its parts. I express great appreciation to all of the outstanding presenters and authors, who, by their diligent efforts in making tight deadlines, created valuable contributions to the scientific body of knowledge for years to come.

Thomas P. Ryan
