SPIE is an international society advancing an interdisciplinary approach to the science and application of light.

Optical Biopsy XVII: Toward Real-Time Spectroscopic Imaging and Diagnosis, edited by Robert R. Alfano, Stavros G. Demos, Angela B. Seddon, Proc. of SPIE Vol. 10873, 1087301 • © 2019 SPIE • CCC code: 1605-7422/19/\$18 • doi: 10.1117/12.2532072

Proc. of SPIE Vol. 10873 1087301-1

The papers in this volume were part of the technical conference cited on the cover and title page. Papers were selected and subject to review by the editors and conference program committee. Some conference presentations may not be available for publication. Additional papers and presentation recordings may be available online in the SPIE Digital Library at SPIDigitalLibrary.org.

The papers reflect the work and thoughts of the authors and are published herein as submitted. The publisher is not responsible for the validity of the information or for any outcomes resulting from reliance thereon.

Please use the following format to cite material from these proceedings:

Paper Numbering: *Proceedings of SPIE* follow an e-First publication model. A unique citation identifier (CID) number is assigned to each article at the time of publication. Utilization of CIDs allows articles to be fully citable as soon as they are published online, and connects the same identifier to all online and print versions of the publication. SPIE uses a seven-digit CID article numbering system structured as follows:

- The first five digits correspond to the SPIE volume number.
- The last two digits indicate publication order within the volume using a Base 36 numbering system employing both numerals and letters. These two-number sets start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B ... 0Z, followed by 10-1Z, 20-2Z, etc. The CID Number appears on each page of the manuscript.

Contents

v	<i>Authors</i>
vii	<i>Conference Committee</i>
ix	<i>Introduction</i>

OPTICAL BIOASSAY PLATFORMS I

10873 04	Oxygenation based perfusion assessment of diabetic foot ulcers using a breath-hold paradigm [10873-3]
10873 05	Semi-automated machine learning approach to segment and register tissue oxygenation maps onto clinical images of wounds [10873-4]

OPTICAL BIOASSAY PLATFORMS II

10873 08	Evaluation of variations in plasma collagen NADH and flavin in pre and post treated breast cancer patients using native fluorescence spectroscopy [10873-7]
----------	--

OPTICAL HISTOLOGY I

10873 0B	Functional vascular imaging by Photoacoustic Microscopy (PAM) and its biomedical application (Invited Paper) [10873-10]
----------	--

SPECTROSCOPIC METHODS I

10873 0J	Innovative and high-performance instrumentation for biomedical Mueller polarimetric imaging in vivo [10873-18]
10873 0N	Diffuse reflectance spectroscopy biomarkers for biological tissues characterization: application to ex-vivo animal tissues [10873-22]
10873 0O	Application of smoothing splines for spectroscopic analysis in hyperspectral images [10873-23]

SPECTROSCOPIC METHODS II

- 10873 0Q **Feasibility of a snapshot hyperspectral imaging for detection of local skin oxygenation**
[10873-25]
- 10873 0R **Separating fluorescence from Raman spectra using a CMOS SPAD TCSPC line sensor for
biomedical applications** [10873-26]

SWIR AND IR METHODS I

- 10873 0T **Advances in medical applications using SWIR light in the wavelength range from 1000 to
2500 nm (Invited Paper)** [10873-28]
- 10873 0U **Mid-infrared spectroscopic imaging to assess wounded tissue health** [10873-29]
- 10873 0V **Observation of live cells' attachment, spreading, and drug interactions using metasurface-
enhanced infrared reflection spectroscopy** [10873-30]
- 10873 0W **Near-infrared deep brain stimulation via upconversion nanoparticle-mediated optogenetics
(Invited Paper)** [10873-31]
- 10873 0X **Mid-infrared OCT imaging in highly scattering samples using real-time upconversion of
broadband supercontinuum covering from 3.6-4.6 μm** [10873-51]

SWIR AND IR METHODS II

- 10873 0Y **Hyperspectral characterization of tissue in the SWIR spectral range: a road to new insight?
(Invited Paper)** [10873-32]
- 10873 11 **Mid-infrared fiber sources for real-time biomedical sensing (Invited Paper)** [10873-36]
- 10873 12 **Progress in biomedical mid-infrared hyperspectral imaging with fiber-based supercontinuum
laser light (Invited Paper)** [10873-37]

POSTER SESSION

- 10873 15 **Distinguish chromophobe renal cell carcinoma and renal oncocytoma based on analysis of
multiphoton microscopic images using convolutional neural network** [10873-40]
- 10873 1A **Human brain glioma grading using label free laser-induced fluorescence spectroscopy**
[10873-46]
- 10873 1C **Alzheimer's disease: label-free fluorescence shows increases in indoleamine 2,3-dioxygenase
(IDO) or tryptophan 2,3-dioxygenase (TDO) activity in affected areas of the brain** [10873-48]

- 10873 1D **Microscopy with ultraviolet surface excitation (MUSE) enables translation of optical biopsy principles to enhance life science education** [10873-49]
- 10873 1F **Breast cancer diagnosis using fluorescence spectroscopy with dual-wavelength excitation and machine learning** [10873-41]

Authors

Numbers in the index correspond to the last two digits of the seven-digit citation identifier (CID) article numbering system used in Proceedings of SPIE. The first five digits reflect the volume number. Base 36 numbering is employed for the last two digits and indicates the order of articles within the volume. Numbers start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B...0Z, followed by 10-1Z, 20-2Z, etc.

Conference Committee

Symposium Chairs

James G. Fujimoto, Massachusetts Institute of Technology (United States)
R. Rox Anderson, Wellman Center for Photomedicine, Massachusetts General Hospital (United States) and Harvard Medical School (United States)

Symposium Co-chairs

Jennifer K. Barton, The University of Arizona (United States)
Wolfgang Drexler, Medical University of Vienna (Austria)

Program Track Chairs

Tuan Vo-Dinh, Fitzpatrick Institute for Photonics, Duke University (United States)
Anita Mahadevan-Jansen, Vanderbilt University (United States)

Conference Chairs

Robert R. Alfano, The City College of New York (United States)
Stavros G. Demos, University of Rochester Laboratory for Laser Energetics (United States)
Angela B. Seddon, The University of Nottingham (United Kingdom)

Conference Program Committee

Nicole J. Crane, Naval Medical Research Center (United States)
Zhiwei Huang, National University of Singapore (Singapore)
Nicusor V. Iftimia, Physical Sciences Inc. (United States)
Amir Gandjbakhche, National Institutes of Health (United States)
Israel Gannot, Johns Hopkins University (United States) and Tel Aviv University (Israel)
Richard M. Levenson, University of California, Davis (United States)
Igor V. Meglinski, University of Oulu (Finland)
Lingyan Shi, Columbia University (United States)
Milind Rajadhyaksha, Memorial Sloan-Kettering Cancer Center (United States)
Kestutis Sutkus, The City College of New York (United States)
Siavash Yazdanfar, Corning Incorporated (United States)
Min Xu, Fairfield University (United States)

Session Chairs

- 1 Optical Bioassay Platforms I
 Nicusor V. Iffimia, Physical Sciences Inc. (United States)
- 2 Optical Bioassay Platforms II
 Lingyan Shi, Columbia University (United States)
- 3 Optical Histology I
 J. Stewart Russell, The City College of New York (United States)

- 7 SWIR and IR Methods I
 J. Stewart Russell, The City College of New York (United States)
- 8 SWIR and IR Methods II
 Angela B. Seddon, The University of Nottingham (United Kingdom)

Introduction

The SPIE Photonics West Conference, Optical Biopsy, was conceived 17 years ago by Professor Alfano, the founding Conference Chair. His simple aim was, and remains, for photonic engineering and scientific development to realise the optical biopsy for real-time information on cancer and disease detection for screening, early diagnosis, and intra-operative monitoring acquiring clinically relevant data without the need for excision biopsies. Thus, to give clinicians the means to have objective medical and biological data to hand at the point of need, the better to take effective and efficient clinical decisions for curative outcomes. The optical biopsy photonic systems aimed at, ideally, should be compact and provide high resolution tissue imaging within seconds, underpinned by machine learning for diagnostic capability based on morphology or molecular recognition and ideally both.

In our 2019 Optical Biopsy conference, we held two days of oral presentations and discussion. These included sessions on optical bioassay platforms, optical histology, spectroscopic methods, and SWIR (short wave infrared) and (mid-infrared) MIR methods, with lively poster sessions on both days. An average of around 70 attendees, throughout the two days, is indicative of vigorous interest from photonic engineers, scientists, and clinicians. Here follows a synopsis of key papers.

Optical Bioassay Platforms included an invited talk on chip-based Raman spectroscopy for microbial sensing from Jürgen Popp (10873-1, Leibniz Institute, Jena, Germany). The WHO (World Health Organization) has stated that in heading toward a post-antibiotic era, microbial resistance is a serious worldwide threat to public health. Raman bio-assay of body-fluid may give faster, reliable, specific diagnostics to inform therapeutic decision-making. Electrophoresis is used to concentrate pathogens in a capturing unit, on-chip. Lingyan Shi (10873-8, Colombia University, United States) presented her very high standard work on SRS (stimulated Raman), with $\sim 10^8\times$ sensitivity of spontaneous Raman, and outstanding label-free 3D imaging; the novelty was introducing D^+ for H^+ to give tissue signatures in the normally cell-silent vibrational region 4-5 μm wavelength.

In the Optical Histology session, high standard work from Virginia University (United States) (paper 10873-10) was on multiparametric photoacoustic microscopy: PAM, which has a unique niche giving label-free imaging with hemoglobin contrast to similar depth as OCT. With a pulsed laser to excite tissue, the absorption gives transient heating and thermoelastic expansion with acoustic emission, for instance, to track brain vasculature (brain cells are invisible to PAM) after stroke.

Day two featured Spectroscopic Methods with innovative, high performance instrumentation for Mueller polarimetric imaging *in vivo* (10873-18, from Ecole Polytechnique and Strasburg University, France) across the visible with multispectral images, wide field, low error, fast acquisition 1-2 s and compact system. Impressive imaging in a hospital setting of cancer margins; collagen orientation is being

detected using liquid crystal alignment. The SWIR and MIR Methods session began with Laura Sordillo (City College of New York, United States, paper 10873-28) who reviewed the state-of-the-art in SWIR, the 4 NIR windows: 650-950 nm, 1100-1350 nm, 1600-1870 nm (so-called: 'Golden Window') and 2100-2300 nm. Light scattering through these windows ranges from none (ballistic photons), to weak (snake-like quasi) to multiple scatter (diffuse scattering). The brain is lipid-rich and 1700 nm is the preferred imaging wavelength. InGaAs IR CCD array suits the third window, which fields the deepest penetration of radiation to see hard wire below chicken tissue. The use of supercontinuum laser for high power, broadband confocal microscopy was discussed. Next up was paper 10873-29 from Birmingham University (United Kingdom) presented by Chris R. Howle; the mid-infrared for wound healing from military injuries like a blast pressure wave, shrapnel, victim-hits-object and flash-burn. FT-(Fourier transform)-IR spectroscopy followed amide B at 3200 cm^{-1} arising from Fermi resonance of the first overtone of amide II and N-H stretching. Two computational methods applied and machine learning: principal components analysis on normalised spectra, taking first derivative, was found best. For the future, a field-compact technique is being developed based on negative contrast instead of FT-IR. Impressive work by Christian Petersen, a young scientist from Denmark Technical University, was on MIR OCT based on 1.5-2.7 μm MOPA laser pumping of a fluoride glass optical fibre (transparent: 0.9-4.7 μm) for SC output of 40mW total over 3.6-4.6 μm . For the imaging, a neat solution was to upconvert the radiation to 820-865 nm for Si detection. Tissue was imaged to 8.6 μm depth and 15 μm spatial resolution—a proof of concept study (10873-51). The conference was brought to a close with exciting developments in the MIR spectral domain by two invited papers. First, Stuart D. Jackson, an acknowledged leader in MIR narrow-line fibre lasers reviewed the state of the art and how this can input molecular hyperspectral imaging (Macquarie University, Australia, paper 10873-36). Finally, paper 10873-37 (Nottingham University, United Kingdom) gave an update of MIR molecular imaging using fibre MIR-SC broadband sources showing the state of the art, but still on excised tissue rather than *in vivo*, the ultimate goal.
