Paper Numbering: Proceedings of SPIE follow an e-First publication model, with papers published first online and then in print and on CD-ROM. Papers are published as they are submitted and meet publication criteria. A unique, consistent, permanent citation identifier (CID) number is assigned to each article at the time of the first publication. Utilization of CIDs allows articles to be fully citable as soon they are published online, and connects the same identifier to all online, print, and electronic versions of the publication. SPIE uses a six-digit CID article numbering system in which:

- The first four digits correspond to the SPIE volume number.
- The last two digits indicate publication order within the volume using a Base 36 numbering system employing both numerals and letters. These two-number sets start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B ... 0Z, followed by 10-1Z, 20-2Z, etc.

The CID number appears on each page of the manuscript. The complete citation is used on the first page, and an abbreviated version on subsequent pages. Numbers in the index correspond to the last two digits of the six-digit CID number.

Introduction

Papers presented this year at the conference on Photons Plus Ultrasound: Imaging and Sensing can be characterized as “interesting and mature.” The field of optoacoustic (photoacoustic, thermoacoustic) tomography has come of age, and the conference featured a number of applications that demonstrated both clinical and commercial value. This in turn, stimulated interest from the industry of medical imaging.

This year we saw many researchers representing small companies and large industry among the usual groups from academic institutions. It is noteworthy that the field of optoacoustic imaging and sensing now has its industrial champion, Seno Medical Instruments of San Antonio, Texas, a company fully dedicated to commercializing the technology discussed at our conference.

Congratulations to Edward Z. Zhang and his colleagues from the University College London, recipients of the annual “Best Paper Award” sponsored by Fairway Medical Technologies of Houston, Texas. Their paper entitled “3D photoacoustic imaging system for in vivo studies of small animal models” represents a significant step in high-resolution imaging of tumor microvasculature using an optical interferometer as an ultrawide band ultrasonic detector.

Manuscripts included in this volume of SPIE's *Progress in Biomedical Optics and Imaging* series have been peer-reviewed by the conference Organizing Committee members. This proceedings volume is an invaluable asset to researchers working not only in the field of biomedical optoacoustics, but also in many other interdisciplinary areas of medical physics, such as medical imaging, monitoring of minimally invasive therapy, diagnostic oncology, hematology, dermatology, and many others.
