Volume 6960

Proceedings of SPIE, 0277-786X, v. 6960

SPIE is an international society advancing an interdisciplinary approach to the science and application of light.

The papers included in this volume were part of the technical conference cited on the cover and title page. Papers were selected and subject to review by the editors and conference program committee. Some conference presentations may not be available for publication. The papers published in these proceedings reflect the work and thoughts of the authors and are published herein as submitted. The publisher is not responsible for the validity of the information or for any outcomes resulting from reliance thereon.

Please use the following format to cite material from this book:

Author(s), "Title of Paper," in *Space Exploration Technologies*, edited by Wolfgang Fink, Proceedings of SPIE Vol. 6960 (SPIE, Bellingham, WA, 2008) Article CID Number.

Copying of material in this book for internal or personal use, or for the internal or personal use of specific clients, beyond the fair use provisions granted by the U.S. Copyright Law is authorized by SPIE subject to payment of copying fees. The Transactional Reporting Service base fee for this volume is \$18.00 per article (or portion thereof), which should be paid directly to the Copyright Clearance Center (CCC), 222 Rosewood Drive, Danvers, MA 01923. Payment may also be made electronically through CCC Online at copyright.com. Other copying for republication, resale, advertising or promotion, or any form of systematic or multiple reproduction of any material in this book is prohibited except with permission in writing from the publisher. The CCC fee code is 0277-786X/08/\$18.00.

Printed in the United States of America.

Publication of record for individual papers is online in the SPIE Digital Library.

SPIDigitalLibrary.org

Paper Numbering: Proceedings of SPIE follow an e-First publication model, with papers published first online and then in print and on CD-ROM. Papers are published as they are submitted and meet publication criteria. A unique, consistent, permanent citation identifier (CID) number is assigned to each article at the time of the first publication. Utilization of CIDs allows articles to be fully citable as soon they are published online, and connects the same identifier to all online, print, and electronic versions of the publication. SPIE uses a six-digit CID article numbering system in which:

- The first four digits correspond to the SPIE volume number.
- The last two digits indicate publication order within the volume using a Base 36 numbering system employing both numerals and letters. These two-number sets start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B ... 0Z, followed by 10-1Z, 20-2Z, etc.

The CID number appears on each page of the manuscript. The complete citation is used on the first page, and an abbreviated version on subsequent pages. Numbers in the index correspond to the last two digits of the six-digit CID number.

PLENARY PAPER

6960 02	Deep space flight of Hayabusa asteroid explorer (Plenary Paper) [6960-100] H. Kuninaka, J. Kawaguchi, Japan Aerospace Exploration Agency (Japan)
---------	--

SESSION 1 LUNAR AND PLANETARY EXPLORATION TECHNOLOGIES

6960 04	Full-scale testing and platform stabilization of a scanning lidar system for planetary landing [6960-01] A. C. M. Allen, C. Langley, R. Mukherji, M. Nimelman, MDA Space Missions (Canada); J. de Lafontaine, D. Neveu, NGC Aerospace (Canada); J. W. Tripp, Optech (Canada)
6960 05	Pico-satellite capabilities for telecommunication and Earth observation [6960-02] M. Schmidt, K. Schilling, Univ. Würzburg (Germany)
6960 06	Extreme environment technologies for space and terrestrial applications [6960-03] T. S. Balint, J. A. Cutts, E. A. Kolawa, C. E. Peterson, Jet Propulsion Lab. (USA)
6960 07	SMART-1 results and future lunar exploration [6960-04] B. H. Foing, ESTEC SCI-S (Netherlands)
6960 08	ILEWG technology roadmap for Moon exploration (Invited Paper) [6960-05] B. H. Foing, ESTEC SCI-S (Netherlands)
6960 09	Lunar landers and sample return: science and technologies [6960-06] B. H. Foing, ESTEC SCI-S (Netherlands)

SESSION 2 AIRBORNE PLATFORMS AND AUTONOMOUS NAVIGATION

6960 0A	Intelligent systems for the autonomous exploration of Titan and Enceladus (Invited Paper) [6960-07] R. Furfaro, J. I. Lunine, J. S. Kargel, Univ. of Arizona (USA); W. Fink, California Institute of Technology (USA)
6960 0B	Multilevel control structure for autonomous robotic aircraft operation (Invited Paper) [6960-08] D. Bassi, Univ. de Santiago de Chile (Chile)
6960 0C	Wind-based navigation of a hot-air balloon on Titan: a feasibility study [6960-09] R. Furfaro, J. I. Lunine, Univ. of Arizona (USA); A. Elfes, K. Reh, Jet Propulsion Lab. (USA)
6960 0D	Rule-based navigation control design for autonomous flight [6960-10] H. Contreras, D. Bassi, Univ. de Santiago de Chile (Chile)

SESSION 3 ROBOTIC RESOURCE EXPLORATION AND LOW-GRAVITY ENVIRONMENTS

- 6960 0F **Robotic resource exploration is a key to human expansion through the cosmos (Invited Paper)** [6960-12]
J. S. Kargel, Univ. of Arizona (USA); W. Fink, California Institute of Technology (USA);
R. Furfaro, Univ. of Arizona (USA); H. Miyamoto, Univ. of Tokyo (Japan)
- 6960 0H **Steerable hopping six-legged robot** [6960-14]
P. Younse, H. Aghazarian, Jet Propulsion Lab. (USA)
- 6960 0I **Granular processes on Itokawa, a small near-Earth asteroid: implications for resource utilization (Invited Paper)** [6960-15]
H. Miyamoto, Univ. of Tokyo (Japan); J. S. Kargel, Univ. of Arizona (USA); W. Fink, California Institute of Technology (USA); R. Furfaro, Univ. of Arizona (USA)
- 6960 0J **Launchable and retrievable tetherbot exploration system** [6960-16]
P. Younse, Jet Propulsion Lab. (USA)

SESSION 4 INTELLIGENT SENSORS AND KNOWLEDGE DISCOVERY

- 6960 0M **Intelligent information extraction to aid science decision making in autonomous space exploration (Invited Paper)** [6960-19]
E. Merényi, K. Tasdemir, Rice Univ. (USA); W. H. Farrand, Space Science Institute (USA)
- 6960 0N **Stochastic optimization framework (SOF) for computer-optimized design, engineering, and performance of multi-dimensional systems and processes (Invited Paper)** [6960-20]
W. Fink, California Institute of Technology (USA)
- 6960 0O **Forward and inverse models for photon transport in soil-ice mixtures and their application to the problem of retrieving optical properties of planetary surfaces** [6960-21]
P. Picca, Politecnico di Torino (Italy); R. Furfaro, J. Kargel, B. D. Ganapol, Univ. of Arizona (USA)
- 6960 0P **Spectral unmixing using nonnegative basis learning: comparison of geometrical and statistical endmember extraction algorithms (Invited Paper)** [6960-22]
M. Parente, Stanford Univ. (USA)

POSTER SESSION

- 6960 0R **ICA-based multi-temporal multi-spectral remote sensing images change detection** [6960-24]
J. Gu, X. Li, C. Huang, Cold and Arid Region Environmental and Engineering Research Institute (China); Y. Y. Ho, Univ. of Central Florida (USA)
- 6960 0S **Micro-cameras for space applications** [6960-25]
S. Beauvivre, Micro-Cameras & Space Exploration (Switzerland)

Symposium Chair

Larry B. Stotts, Defense Advanced Research Projects Agency (USA)

Symposium Cochair

Ray O. Johnson, Lockheed Martin Corporation (USA)

Program Track Chairs

Thomas George, ViaLogy Corporation (USA)

Peter Tchoryk, Jr., Michigan Aerospace Corporation (USA)

Conference Chair

Wolfgang Fink, California Institute of Technology (USA)

Program Committee

Danilo Bassi, Universidad de Santiago de Chile (Chile)

Bernard Foing, International Lunar Exploration Working Group (ILEWG) (Netherlands) and European Space Agency, European Space Research and Technology Centre (ESA/ESTEC) (Netherlands)

Roberto Furfaro, The University of Arizona (USA)

Jeffrey S. Kargel, The University of Arizona (USA)

Session Chairs

- 1 Lunar and Planetary Exploration Technologies
Bernard Foing, International Lunar Exploration Working Group (ILEWG) (Netherlands) and European Space Agency, European Space Research and Technology Centre (ESA/ESTEC) (Netherlands)
Wolfgang Fink, California Institute of Technology (USA)
- 2 Airborne Platforms and Autonomous Navigation
Danilo F. Bassi, Universidad de Santiago de Chile (Chile)
Wolfgang Fink, California Institute of Technology (USA)
- 3 Robotic Resource Exploration and Low-Gravity Environments
Jeffrey S. Kargel, The University of Arizona (USA)
Wolfgang Fink, California Institute of Technology (USA)
- 4 Intelligent Sensors and Knowledge Discovery
Roberto Furfaro, The University of Arizona (USA)
Wolfgang Fink, California Institute of Technology (USA)

Introduction

Space exploration technologies face several extreme environments, not only in interplanetary and orbital missions but also during in situ missions targeting planetary atmospheres, surfaces, and sub-surfaces. Terrestrial parallels exist in potentially hazardous or inaccessible operational areas on Earth such as those related to military (battlefield, check points, mine-fields), terrorist activities (stand-off detection of IEDs), or areas that have been exposed to bio-chemical agents, radiation, or natural disasters. Advanced technologies are required that go beyond conventional manned and robotic planetary exploration missions, which are inadequate to address the needs for the next generation of missions that will be necessary to pave the way for human exploration back to the Moon and to Mars, and also for autonomous deployment in battlefield scenarios.

In the particular case of reconnaissance missions, some of the key features to be afforded by future mission architectures include:

- Global to regional to local reconnaissance; mission safety and redundancy (i.e. fault-tolerance)
- (real time) Identification and characterization of transient events
- Targeted agent/sensor deployment in regions of interest (e.g., "hot" zones)
- Optimized target identification and obstacle avoidance
- Efficient commanding of multiple ground agents.

Potential applications range from planetary exploration and mining, to homeland security, border control, battlefield surveillance, harbor surveillance, maritime vessel tracking, telecommunications relay, and weather observations.

As with all space missions, payload mass, size, power consumption, and communication remain the overarching constraints/challenges. Moreover, to support and control future space exploration mission architectures, a high degree of operational autonomy is necessary. Essential requirements of such operation autonomy are:

- Automatic mapping of an operational area from different vantage points (i.e., space, airborne, surface/subsurface), including vehicle health monitoring
- Automatic feature extraction and target/region-of-interest/anomaly identification within the mapped operational area, which includes sensor data fusion, sensor interoperability, and intelligent data downlink
- Automatic target prioritization for close-up examination and timely counter-measures
- Automatic (targeted) deployment and (concurrent) navigation of sensor platforms and individual sensors.

The scope of the conference includes topics in basic research in hardware and software development, component and subsystem level development, and design and implementation of missions for space, defense, and homeland security applications.

Wolfgang Fink
