Volume 7075

Proceedings of SPIE, 0277-786X, v. 7075

SPIE is an international society advancing an interdisciplinary approach to the science and application of light.

The papers included in this volume were part of the technical conference cited on the cover and title page. Papers were selected and subject to review by the editors and conference program committee. Some conference presentations may not be available for publication. The papers published in these proceedings reflect the work and thoughts of the authors and are published herein as submitted. The publisher is not responsible for the validity of the information or for any outcomes resulting from reliance thereon.

Please use the following format to cite material from this book:

The Transactional Reporting Service base fee for this volume is \$18.00 per article (or portion thereof), which should be paid directly to the Copyright Clearance Center (CCC), 222 Rosewood Drive, Danvers, MA 01923. Payment may also be made electronically through CCC Online at copyright.com. Other copying for republication, resale, advertising or promotion, or any form of systematic or multiple reproduction of any material in this book is prohibited except with permission in writing from the publisher. The CCC fee code is 0277-786X/08/\$18.00.

Printed in the United States of America.

Publication of record for individual papers is online in the SPIE Digital Library.

SPIDigitalLibrary.org

Paper Numbering: Proceedings of SPIE follow an e-First publication model, with papers published first online and then in print and on CD-ROM. Papers are published as they are submitted and meet publication criteria. A unique, consistent, permanent citation identifier (CID) number is assigned to each article at the time of the first publication. Utilization of CIDs allows articles to be fully citable as soon they are published online, and connects the same identifier to all online, print, and electronic versions of the publication. SPIE uses a six-digit CID article numbering system in which:

- The first four digits correspond to the SPIE volume number.
- The last two digits indicate publication order within the volume using a Base 36 numbering system employing both numerals and letters. These two-number sets start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B ... 0Z, followed by 10-1Z, 20-2Z, etc.

The CID number appears on each page of the manuscript. The complete citation is used on the first page, and an abbreviated version on subsequent pages. Numbers in the index correspond to the last two digits of the six-digit CID number.

Contents

vii *Conference Committee*

ix *Introduction*

SESSION 1 COMPRESSION I

- 7075 02 **Data compression in emitter location systems via sensor pairing and selection** [7075-01]
X. Hu, M. L. Fowler, Binghamton Univ. (United States)
- 7075 03 **Impact of signal model on data compression for TDOA/FDOA emitter location** [7075-02]
M. L. Fowler, X. Hu, Binghamton Univ. (United States)
- 7075 05 **Impact of wavelet types on image data characteristics during compression** [7075-04]
D. S. Myers, D. K. Melgaard, R. H. Byrne, P. J. Lewis, Sandia National Labs. (United States)

SESSION 2 COMPRESSION II

- 7075 06 **Optimization of HVS-based objective image quality assessment with eye tracking**
[7075-05]
K. Fliegel, Czech Technical Univ. in Prague (Czech Republic)
- 7075 07 **Analysis of compression of 4D volumetric medical image datasets using multi-view (MVC)
video coding methods** [7075-06]
U.-E. Martin, Siemens AG (Germany); A. Kaup, Univ. of Erlangen-Nuremberg (Germany)
- 7075 08 **Lossless compression of images with permutation codes** [7075-08]
Z. Arnavut, M. Arnavut, SUNY Fredonia (United States)

SESSION 3 WATERMARKING AND AUTHENTICATION I

- 7075 09 **A comparative study on insertion strategies in MPEG-4 AVC watermarking** [7075-09]
S. Duta, M. Mitrea, M. Belhaj, F. Prêteux, Institut TELECOM (France)
- 7075 0A **GLCM and neural network-based watermark identification** [7075-10]
L. McLauchlan, Texas A&M Univ., Kingsville (United States); M. Mehrübeoğlu, Texas A&M
Univ., Corpus Christi (United States)
- 7075 0B **Neural network-based watermark embedding and identification** [7075-11]
L. McLauchlan, Texas A&M Univ., Kingsville (United States); M. Mehrübeoğlu, Texas A&M
Univ., Corpus Christi (United States)

SESSION 4 WATERMARKING AND AUTHENTICATION II

- 7075 0C **Theoretical limits in DWT video watermarking** [7075-12]
O. Dumitru, M. Mitrea, F. Prêteux, Institut TELECOM (France)
- 7075 0D **An image watermark tutorial tool using Matlab** [7075-13]
K. Heylen, Univ. College of Antwerp (Belgium); T. Dams, Univ. College of Antwerp (Belgium) and Vrije Univ. Brussel (Belgium)

SESSION 5 ERROR ANALYSIS

- 7075 0E **The optimum approximation of an orthogonal expansion having bounded higher order correlations of stochastic coefficients** [7075-15]
Y. Kida, Ohu Univ. (Japan); T. Kida, Tokyo Institute of Technology (Japan) and Nihon Univ. (Japan)
- 7075 0F **Simultaneous minimization of various worst case measures of error in FIR filter bank** [7075-16]
Y. Kida, Ohu Univ. (Japan); T. Kida, Tokyo Institute of Technology (Japan) and Nihon Univ. (Japan)

SESSION 6 HYPERSPECTRAL IMAGING AND PROCESSING

- 7075 0H **Flash hyperspectral imaging of non-stellar astronomical objects** [7075-19]
J. F. Scholl, College of Optical Sciences, Univ. of Arizona (United States) and Steward Observatory, Univ. of Arizona (United States); E. K. Hege, MKS Imaging Technology, LLC (United States) and Steward Observatory, Univ. of Arizona (United States); M. Hart, College of Optical Sciences, Univ. of Arizona (United States); D. O'Connell, Hnu Photonics (United States); E. L. Dereniak, College of Optical Sciences, Univ. of Arizona (United States)
- 7075 0I **Area-based novel approach for fuzzy edge detection using type II fuzzy sets** [7075-20]
V. K. Madasu, Queensland Univ. of Technology (Australia); M. Hanmandlu, Indian Institute of Technology Delhi (India); S. Vasikarla, American InterContinental Univ. (United States)
- 7075 0J **Compensation method for quantitative observation of multicolor fluorescence with nonlinear mapping** [7075-22]
S. Morishita, Univ. of Tokyo (Japan); H. Yokota, RIKEN (Japan); H. Asama, Univ. of Tokyo (Japan); R. Himeno, RIKEN (Japan); T. Mishima, Saitama Univ. (Japan)
- 7075 0K **A new quality assessment index for compressed remote sensing image** [7075-23]
L. Zhai, X. Tang, Chinese Academy of Surveying and Mapping (China); G. Zhang, Wuhan Univ. (China)

POSTER SESSION

- 7075 0L **Dynamic mixing kernels in Gaussian mixture classifier for hyperspectral classification** [7075-29]
V. Jayaram, B. Usevitch, The Univ. of Texas at El Paso (United States)

- 7075 0N **Finding the temperature using image analysis techniques** [7075-27]
A. Oprisan, S. A. Oprisan, College of Charleston (United States); J. Hegseth, Univ. of New Orleans (United States); Y. Garrabos, Institut de Chimie de la Matière Condensée de Bordeaux, CNRS, Univ. Bordeaux (France); D. Beysens, Equipe du Supercritique pour l'Environnement (France) and Ecole Supérieure de Physique et Chimie Industrielles (France)
- 7075 0O **A Radix 4 based system for information theory** [7075-32]
B. S. Tice, Advanced Human Design (United States)
- 7075 0P **A comparison of a Radix 2 and a Radix 5 based systems** [7075-26]
B. S. Tice, Advanced Human Design (United States)
- 7075 0Q **The analysis of binary, ternary and quaternary-based systems for communications theory** [7075-30]
B. S. Tice, Advanced Human Design (United States)

Conference Chairs

Mark S. Schmalz, University of Florida (United States)
Gerhard X. Ritter, University of Florida (United States)
Junior Barrera, Universidade de São Paulo (Brazil)
Jaakko T. Aistola, Tampere University of Technology (Finland)

Program Track Chair

Khan M. Iftekharruddin, The University of Memphis (United States)

Program Committee

Stefano Baronti, Istituto di Fisica Applicata Nello Carrara (Italy)
Mark L. Fowler, Binghamton University (United States)
Victoria T. Franques, U.S. Dept. of Energy (United States)
Andrea Garzelli, Università degli Studi di Siena (Italy)
Abdelsalam A. Helal, University of Florida (United States)
Lifford McLauchlan, Texas A&M University, Kingsville (United States)
Daniel S. Myers, Sandia National Laboratories (United States)
James F. Scholl, College of Optical Sciences, The University of Arizona (United States)

Session Chairs

- 1 Compression I
 Mark L. Fowler, Binghamton University (United States)
- 2 Compression II
 Mark S. Schmalz, University of Florida (United States)
- 3 Watermarking and Authentication I
 James F. Scholl, College of Optical Sciences, The University of Arizona (United States)
- 4 Watermarking and Authentication II
 Lifford McLauchlan, Texas A&M University, Kingsville (United States)
- 5 Error Analysis
 Mark S. Schmalz, University of Florida (United States)
- 6 Hyperspectral Imaging and Processing
 James F. Scholl, College of Optical Sciences, The University of Arizona (United States)

Introduction

Image compression, encryption, and pattern recognition are technologies in computer science that are emerging as crucial supports for diverse applications in many fields. Traditionally, image compression is directed toward increasing storage efficiency, effective communication channel bandwidth, and data security. Illustrative applications include videotelephony, remote sensing, and Internet delivery of still imagery and video, as well as storage, retrieval, and processing of medical, military, or environmental image processing. Increasingly, image compression is being used to reduce data prior to processing — in practice, special types of compression transforms can be employed in preprocessing to extract key features from imaging sensor datastreams.

In particular, researchers are focusing on the segmentation and understanding of digital imagery using pattern recognition technology. Examples include partitioning of remote sensing datacubes into spectral regions and features of mission-specific interest, as well as exploiting multispectral or hyperspectral signatures for medical imaging, military target recognition, or security applications that integrate compression and digital watermarking.

A key topic of interest emphasizes how spatial properties of image data support compression as well as pattern recognition. However, the union of object recognition and object-based compression increasingly offers useful insights into this challenging problem. Finally, although numerous perceptual measures have been developed for assessing image quality in decompressed imagery, there remain few measures that address non-perceptual problems such as local (e.g., feature-specific) distortion in objects or classes of objects typically present in medical or military images. Additional problems in image and video quality measures include their correspondence with human evaluations of image quality, as well as the poorly understood process of semantic correspondence between images or video sequences.

This conference on the mathematics of data and image pattern recognition, compression, and encryption addresses the theory, design, analysis, and testing of pattern recognition, compression, and encryption (e.g., watermarking) algorithms. In response to conference presenters' and attendees' requests in this and previous years, we continue to emphasize security applications and theory/practice of error measurement. Example applications include video analysis and compression (e.g., surveillance and remote sensing), as well as survivable watermarks. Thus, the first session of this conference addresses several theoretical issues in compression, in particular, model-based analysis and optimization of compression transforms for emitter location (TDOA and FDOA), object-based compression of video sequences, and optimal wavelet selection.

The second session addresses a crucial area of compression theory and algorithm design, namely, the analysis and quantification of error decompressed imagery. Theory, algorithms, and practical techniques are presented for estimating error using a perceptual model based on foveation and eye movements in the human visual system. Compression of 4D volumetric medical imagery is discussed in terms of computational cost and error, then permutation-based codebook design is explored as a technique for improving the efficiency of lossless compression.

The third and fourth sessions cover watermarking and security, which are key to commercial multimedia applications (e.g., anti-piracy measures). The identification of watermarking using adaptive model-based analysis of neural networks and embedding of watermarks in the compressed domain are featured papers. Also, watermark insertion strategies for MPEG are comparatively evaluated.

The fifth session emphasizes error analysis techniques, including computational error analysis. The first two papers concentrate on the theory of optimal filter selection in orthogonal expansions, with application to optimization of finite impulse response filter banks. The final paper in this session discusses a bit-level technique for precise estimation of arithmetic error in floating-point computations, which is germane to the assessment and prediction of compression transform error.

The sixth session focuses on hyperspectral imaging theory, in particular, analysis of biomolecular imaging and fluorescence with respect to non-linear mapping techniques. Other topics include hyperspectral imaging of non-stellar astronomical objects, including enhancement based on mixture model theory.

Throughout its 11-year history, this conference has successfully convened numerous scientific researchers from many nations in a variety of theoretical development, analysis, and test areas pertaining to pattern recognition, segmentation, image understanding, compression, coding, and encryption. Despite their success in defining and resolving several important problems in image and video representation, much research remains in the basic mathematical nature, characterization, and performance analysis of pattern recognition and compression algorithms. For example, what properties of data facilitate compression or encryption; in particular, what makes digital watermarks survivable in given data and processing contexts?

The next conference in this series, scheduled for the SPIE 2009 annual meeting, will continue the topical focus of this conference, extending the area of pattern recognition to analyze extremely low bit-rate video compression, as well as forensic watermarking. The continued emphasis on theory and algorithms for data security will motivate engineers, scientists, and algorithm designers to investigate new areas of compression, coding, and encryption technologies. Planned areas of emphasis include, but are not limited to, forensic watermarking

that is robust to attack as well as provides a means for tracking attacks. Continued emphasis will be directed toward compression theory and algorithms for exploiting digital signals and imagery acquired via sensor networks. Hyperspectral image processing, as well as sensing and processing using compressed datastreams only, are planned topics for our 2009 conference. We also plan to continue emphasizing error analysis and performance metrics for compression, computation, and image/video perception. Related illustrative application areas will emphasize environmental, forensic, law enforcement, military, and medical image and signal compression and encryption.
