SPIE is an international society advancing an interdisciplinary approach to the science and application of light.

The papers included in this volume were part of the technical conference cited on the cover and title page. Papers were selected and subject to review by the editors and conference program committee. Some conference presentations may not be available for publication. The papers published in these proceedings reflect the work and thoughts of the authors and are published herein as submitted. The publisher is not responsible for the validity of the information or for any outcomes resulting from reliance thereon.

Please use the following format to cite material from this book:

Author(s), "Title of Paper," in *Solar Hydrogen and Nanotechnology IV*, edited by Frank E. Osterloh, Proceedings of SPIE Vol. 7408 (SPIE, Bellingham, WA, 2009) Article CID Number.

Copying of material in this book for internal or personal use, or for the internal or personal use of specific clients, beyond the fair use provisions granted by the U.S. Copyright Law is authorized by SPIE subject to payment of copying fees. The Transactional Reporting Service base fee for this volume is \$18.00 per article (or portion thereof), which should be paid directly to the Copyright Clearance Center (CCC), 222 Rosewood Drive, Danvers, MA 01923. Payment may also be made electronically through CCC Online at copyright.com. Other copying for republication, resale, advertising or promotion, or any form of systematic or multiple reproduction of any material in this book is prohibited except with permission in writing from the publisher. The CCC fee code is 0277-786X/09/\$18.00.

Printed in the United States of America.

Publication of record for individual papers is online in the SPIE Digital Library.

SPIDigitalLibrary.org

Paper Numbering: Proceedings of SPIE follow an e-First publication model, with papers published first online and then in print and on CD-ROM. Papers are published as they are submitted and meet publication criteria. A unique, consistent, permanent citation identifier (CID) number is assigned to each article at the time of the first publication. Utilization of CIDs allows articles to be fully citable as soon they are published online, and connects the same identifier to all online, print, and electronic versions of the publication. SPIE uses a six-digit CID article numbering system in which:

- The first four digits correspond to the SPIE volume number.
- The last two digits indicate publication order within the volume using a Base 36 numbering system employing both numerals and letters. These two-number sets start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B ... 0Z, followed by 10-1Z, 20-2Z, etc.

The CID number appears on each page of the manuscript. The complete citation is used on the first page, and an abbreviated version on subsequent pages. Numbers in the index correspond to the last two digits of the six-digit CID number.

Contents

- v Conference Committee
- vii Introduction
- ix Concentrating solar energy for utility scale applications (Plenary Paper) [7407-106]
R. Sherif, eSolar, Inc. (United States)
- xv Photovoltaic-reliability R&D toward a solar-powered world (Plenary Paper) [7412-104]
S. Kurtz, National Renewable Energy Lab. (United States); J. Granata, M. Quintana, Sandia National Labs. (United States)

PLENARY SESSION

- 7408 02 **Recent progress in photocatalysts for overall water splitting under visible light (Plenary paper)** [7408-103]
T. Hisatomi, K. Domen, The Univ. of Tokyo (Japan)

SEMICONDUCTOR FILMS: FABRICATION, STRUCTURE, AND PROPERTIES

- 7408 06 **Low cost solar silicon production** [7408-04]
M. Mede, Thermal Technology, LLC (United States)
- 7408 07 **Chemical vapor deposition of copper oxide films for photoelectrochemical hydrogen production** [7408-05]
G. Guglietta, T. Wanga, R. Pati, S. Ehrman, R. A. Adomaitis, Univ. of Maryland, College Park (United States)
- 7408 08 **Pulsed laser deposition of metal oxide photoelectrodes for solar-driven hydrogen production: fabrication techniques** [7408-06]
C. X. Kronawitter, S. S. Mao, Univ. of California, Berkeley (United States) and Lawrence Berkeley National Lab. (United States)

DOPED SEMICONDUCTORS: OPTIMIZING ELECTRONIC STRUCTURE

- 7408 0A **TiO₂-based photosensitive oxide semiconductors for solar hydrogen (Invited Paper)** [7408-08]
J. Nowotny, T. Bak, Univ. of Western Sydney (Australia)
- 7408 0D **Photoelectrochemical and structural characterization of carbon-doped In₂O₃ and carbon-doped WO₃ films prepared via spray pyrolysis (Invited Paper)** [7408-11]
Y. Sun, R. Rajpura, D. Rafferty, Purdue Univ. (United States)

NANOSTRUCTURED COMPOSITES: INTERFACIAL PROCESSES AND PHOTOCATALYTIC PROPERTIES I

- 7408 0G **Optical excitations of metallic nanoclusters buried in TiO₂ for solar photochemistry** [7408-14]
F. Wang, F. Womack, P. T. Sprunger, R. L. Kurtz, Louisiana State Univ. (United States)

SYNTHETIC ASPECTS OF PHOTOCATALYTIC MATERIALS

- 7408 0N **TiO₂ and TiO₂/WO₃ porous film electrodes for application in solar energy conversion** [7408-21]
H. G. Oliveira, E. D. Silva, C. Longo, State Univ. of Campinas (Brazil)
- 7408 0O **Characterization of Fe-TiO₂ films synthesized by sol-gel method for application in energy conversion devices** [7408-22]
R. da Silva Santos, H. G. de Oliveira, C. Longo, State Univ. of Campinas (Brazil)

NEW APPROACHES TO SOLAR WATER SPLITTING DEVICES

- 7408 0S **Silicon and tungsten oxide nanostructures for water splitting** [7408-26]
K. R. Reyes Gil, J. M. Spurgeon, N. S. Lewis, California Institute of Technology (United States)
- 7408 0U **Single crystal semiconductor micropillar and nanowire on amorphous substrates for low cost solar hydrogen generation** [7408-28]
V. J. Logeeswaran, A. M. Katzenmeyer, M.-K. Kwon, J.-Y. Kim, M. S. Islam, Univ. of California, Davis (United States)
- 7408 0V **A bio-inspired molecular water oxidation catalyst for renewable hydrogen generation: an examination of salt effects (Invited Paper)** [7408-29]
R. Brimblecombe, M. Rotstein, A. Koo, Monash Univ. (Australia); G. C. Dismukes, Princeton Univ. (United States); G. F. Swiegers, Univ. of Wollongong (Australia); L. Spiccia, Monash Univ. (Australia)

POSTER SESSION

- 7408 0W **Apparatus for H₂ photosynthesis** [7408-30]
D. G. Lewis, M. R. Otto, Solar Redox Group (United States)

Introduction

This fourth symposium on Solar Hydrogen and Nanotechnology was again devoted to the conversion of abundant solar energy into hydrogen fuel, i.e. chemical energy.

This year's focus was on photoelectrolytic approaches, either as photo-electrochemical cells or as self supported catalysts. Here, the key issue is to develop materials that are able to absorb a significant portion of the solar spectrum while producing a strong enough bias for either water oxidation reduction or both reactions.

Several approaches to fabricate such materials including chemical vapor deposition, sol-gel processes, electrochemistry, vapor-liquid-solid growth, pyrolysis, photolithography, and conventional high temperature solid state synthesis were presented. Promising compounds include hematite, cuprous oxide, gallium nitride, zinc oxide, titania and titanates, tungsten oxide and nitride, silicon and silicon carbide, niobium oxide, and cadmium, indium, and copper chalcogenides. To enhance visible light absorption, heteroatom doping, and sensitization with ruthenium dyes and cadmium sulfide quantum dots were explored. New molecular approaches to generating water splitting catalysts including manganese oxide clusters and platinum complexes as cocatalysts were also demonstrated.

Besides material composition, the particle morphology strongly affects the properties and functions of the catalyst, and hence needs to be controlled. Rod-like, sheet-like, and more complex structures with features on the nano and microscale were demonstrated to have activity as photocatalysts. Several presentations described how rod-like nanostructures could be integrated into multi-component nanostructures for water splitting.

The characterization of solar water splitting catalysts was another focus area at the symposium. Besides general techniques, photoelectron spectroscopy, photoelectrochemistry, electrochemical impedance spectroscopy, and time resolved optical spectroscopy were found especially useful for elucidating the compositions, properties, and function of water splitting catalysts and devices.

Overall, the development of methods for efficient solar energy to fuel conversion remains one of the great challenges in science. Prof. Kazunari Domen estimates that with photoelectrochemical cells, 5-10% conversion efficiency may be reachable within the next 5 years, whereas for self-supported photocatalysts 5% over 10 years maybe more realistic.

On the other hand, research on photochemical water splitting goes beyond direct applications, and will continue to have a positive impact on solar energy conversion in general, materials synthesis, characterization, and the development of new analytical techniques for years to come.

I'd like to thank Prof. T. Nejat Veziroglu from the International Journal for Hydrogen Energy and the Donors of The American Chemical Society Petroleum Research Fund, for partial support of this symposium.

Frank E. Osterloh
