Volume 7938

Proceedings of SPIE, 0277-786X, v. 7938

SPIE is an international society advancing an interdisciplinary approach to the science and application of light.

The papers included in this volume were part of the technical conference cited on the cover and title page. Papers were selected and subject to review by the editors and conference program committee. Some conference presentations may not be available for publication. The papers published in these proceedings reflect the work and thoughts of the authors and are published herein as submitted. The publisher is not responsible for the validity of the information or for any outcomes resulting from reliance thereon.

Please use the following format to cite material from this book:

Copying of material in this book for internal or personal use, or for the internal or personal use of specific clients, beyond the fair use provisions granted by the U.S. Copyright Law is authorized by SPIE subject to payment of copying fees. The Transactional Reporting Service base fee for this volume is \$18.00 per article (or portion thereof), which should be paid directly to the Copyright Clearance Center (CCC), 222 Rosewood Drive, Danvers, MA 01923. Payment may also be made electronically through CCC Online at copyright.com. Other copying for republication, resale, advertising or promotion, or any form of systematic or multiple reproduction of any material in this book is prohibited except with permission in writing from the publisher. The CCC fee code is 0277-786X/11/\$18.00.

Printed in the United States of America.

Publication of record for individual papers is online in the SPIE Digital Library.

SPIDigitalLibrary.org

Paper Numbering: Proceedings of SPIE follow an e-First publication model, with papers published first online and then in print and on CD-ROM. Papers are published as they are submitted and meet publication criteria. A unique, consistent, permanent citation identifier (CID) number is assigned to each article at the time of the first publication. Utilization of CIDs allows articles to be fully citable as soon as they are published online, and connects the same identifier to all online, print, and electronic versions of the publication. SPIE uses a six-digit CID article numbering system in which:

- The first four digits correspond to the SPIE volume number.
- The last two digits indicate publication order within the volume using a Base 36 numbering system employing both numerals and letters. These two-number sets start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B ... 0Z, followed by 10-1Z, 20-2Z, etc.

The CID number appears on each page of the manuscript. The complete citation is used on the first page, and an abbreviated version on subsequent pages. Numbers in the index correspond to the last two digits of the six-digit CID number.

Contents

v	Conference Committee
vii	Introduction

SESSION 1 THZ IMAGING, SPECTROSCOPY, AND INSTRUMENTATION

- 7938 02 **Advancements in photomixing and photoconductive switching for THz spectroscopy and imaging (Invited Paper)** [7938-01]
E. R. Brown, Wright State Univ. (United States) and Physical Domains, LLC (United States)
- 7938 03 **New experimental methods in terahertz spectroscopy** [7938-02]
E. J. Slingerland, T. M. Goyette, R. H. Giles, Univ. of Massachusetts Lowell (United States);
W. E. Nixon, United States Army, National Ground Intelligence Ctr. (United States)
- 7938 04 **Encoding terahertz signatures into laser-induced plasma acoustic waves** [7938-03]
B. Clough, J. Liu, X.-C. Zhang, Rensselaer Polytechnic Institute (United States)
- 7938 05 **Efficient material parameters estimation with terahertz time-domain spectroscopy** [7938-04]
O. S. Ahmed, McMaster Univ. (Canada); M. A. Swillam, Univ. of Toronto (Canada);
M. H. Bakr, X. Li, McMaster Univ. (Canada)
- 7938 06 **Terahertz imaging in dielectric media with quasi-Bessel beams** [7938-05]
Z. Zhang, T. Buma, Univ. of Delaware (United States)
- 7938 07 **Comparison of GaAs and DAST electro-optic crystals for THz time domain spectroscopy using 1.55 μm fiber laser pulses** [7938-06]
M. Martin, J. Mangeney, P. Crozat, Institut d'Electronique Fondamentale, CNRS, Univ. Paris-Sud 11 (France); P. Mounaix, CPMOH, CNRS, Univ. Bordeaux 1 (France)
- 7938 08 **Terahertz time-lapse imaging of hydration in physiological tissues** [7938-20]
D. B. Bennett, Z. D. Taylor, N. Bajwa, P. Tewari, A. Maccabi, S. Sung, Univ. of California, Los Angeles (United States); R. S. Singh, M. O. Culjat, Univ. of California, Los Angeles (United States) and Univ. of California, Santa Barbara (United States); W. S. Grundfest, Univ. of California, Los Angeles (United States); E. R. Brown, Wright State Univ. (United States)

SESSION 2 THZ MODELING AND SIMULATION

- 7938 09 **The effects of various approximations on electron-electron scattering calculations in QCLs** [7938-07]
P. Slingerland, C. Baird, R. Giles, Univ. of Massachusetts Lowell (United States)
- 7938 0A **Semiconductor-coated deep subwavelength spoof surface plasmonic waveguide for THz and MIR applications** [7938-08]
R. Yang, W. Zhao, Rochester Institute of Technology (United States); R. A. Soref, Air Force Research Lab. (United States); Z. Lu, Rochester Institute of Technology (United States)

- 7938 0B **Optical frequency conductance model of terahertz/infrared emission and detection in semiconductors** [7938-09]
T. Szkopek, E. Ledwosinska, McGill Univ. (Canada)

SESSION 3 THZ SOURCES, GENERATION, AND DETECTION

- 7938 0C **THz lasing concepts based upon InAs/GaSb broken-gap heterostructures (Invited Paper)** [7938-10]
D. Woolard, U.S. Army Research Office (United States) and North Carolina State Univ. (United States); W. Zhang, North Carolina State Univ. (United States)
- 7938 0E **THz thermal emission from a 1D photonic crystal** [7938-12]
I. A. Zimmerman, Z. Wu, H. Xin, R. Ziolkowski, The Univ. of Arizona (United States)
- 7938 0F **Nb₅N₆ bolometer operated at room temperature for detecting at 100 GHz** [7938-13]
L. Kang, X. H. Lu, J. Chen, C. H. Cao, W. W. Xu, B. B. Jin, P. H. Wu, Nanjing Univ. (China); Q. J. Yao, S. C. Shi, The Purple Mountain Observatory (China)

SESSION 4 THZ MATERIALS AND CONFIGURATIONS

- 7938 0H **Applications of holography in the millimeter-wave and terahertz region** [7938-15]
I. McAuley, J. A. Murphy, N. Trappe, R. Mahon, D. McCarthy, P. McLaughlin, National Univ. of Ireland, Maynooth (Ireland)
- 7938 0I **Electromagnetic crystal (EMXT)-based THz components** [7938-16]
Z. Wu, Stanford Linear Accelerator Ctr. (United States); W.-R. Ng, M. Gehm, H. Xin, The Univ. of Arizona (United States)
- 7938 0J **Modelling of horn antennas and detector cavities for the SAFARI instrument at THz frequencies** [7938-17]
S. Doherty, N. Trappe, C. O'Sullivan, J. A. Murphy, G. Curran, National Univ. of Ireland, Maynooth (Ireland); P. Mauskopf, J. Zhang, Cardiff Univ. (United Kingdom); S. Withington, D. Goldie, D. Glowaka, Univ. of Cambridge (United Kingdom); P. Khosropanah, M. Ridder, M. Bruijn, J. R. Gao, SRON Netherlands Institute for Space Research (Netherlands); D. Griffin, B. Swinyard, M. Ferlot, Rutherford Appleton Lab. (United Kingdom)
- 7938 0K **Terahertz antiresonant reflecting hollow-core waveguides for sensing applications** [7938-18]
B. You, J.-Y. Lu, National Cheng Kung Univ. (Taiwan); C.-Y. Chan, C.-P. Yu, National Sun Yat-Sen Univ. (Taiwan); H.-Z. Chen, National Cheng Kung Univ. (Taiwan); T.-A. Liu, J.-L. Peng, Industrial Technology Research Institute (Taiwan)

POSTER SESSION

- 7938 0L **Some aspects of far-infrared spectroscopy of explosive materials** [7938-19]
N. Palka, T. Trzcinski, Military Univ. of Technology (Poland)

- 4 THz Materials and Configurations
R. Jennifer Hwu, InnoSys, Inc. (United States)
Robert H. Giles, University of Massachusetts Lowell (United States)

Introduction

The 2011 Terahertz Technology and Applications Conference was divided into four sessions reflecting specific categories as follows: Session 1: THz Imaging, Spectroscopy, and Instrumentation, Session 2: THz Modeling and Simulation, Sessions 3: THz Sources, Generation, and Detection, and Session 4: THz Materials and Configurations.

Session 1 included an invited paper by Professor Elliott Brown covering advancements in photomixing and photoconductive switching for terahertz spectroscopy and imaging, and papers on some new experimental methods in terahertz spectroscopy, encoding terahertz signatures in laser induced plasma acoustic waves, efficient material parameters estimation with terahertz time domain spectroscopy, terahertz imaging of dielectric media with quasi-Bessel beams, comparison of GaAs and DAST electro-optic crystals for terahertz time domain spectroscopy, and terahertz time lapse videos of hydration in physiological tissues.

Session 2 included papers on the effects of various approximations on the electron-electron scattering calculations in quantum cascade lasers, spoof surface plasmonic waveguides for terahertz and mid infrared applications, and optical frequency conductance modelling of terahertz/infrared emission and detection in quantum wells, quantum dots, and narrow gap semiconductors.

Session 3 began with an invited paper by Dr. Dwight Woolard of the Army Research Office on terahertz lasing concepts based upon InAs/GaSb broken-gap heterostructures; unfortunately, due to bad weather conditions that gripped most of the United States Eastern region, Dr. Woolard was unable to attend the conference due to cancelled airline flights. Fortunately the paper associated with the talk is included in this proceedings. The other papers in this session include ones on a mechanically tunable terahertz modulator based on antiresonant reflecting hollow waveguides, terahertz emission from a 1-D photonic crystal, a novel room temperature Nb₅N₆ microbolometer for detecting signals in the terahertz region, and terahertz and millimeter-wave vacuum electronic sources.

Session 4 began with a paper on the applications of holography in the millimeter-wave and terahertz region, and included additional papers on electromagnetic crystal based terahertz components, modelling of detector cavities at terahertz frequencies and terahertz antiresonant reflecting hollow core waveguides for sensing applications.

Terahertz dynamics of ionic liquids from a combined dielectric relaxation, terahertz, and optical Kerr effect study, and included additional papers on electric coupling resonance variation in THz metamaterials, a floating gate

double quantum well far-infrared photoconductor, design and performance of reflective ultra broadband terahertz time-domain spectroscopy with air-biased-coherent-detection, and concluded with a paper on the design of hybrid GaAs waveguide emitters for generation of terahertz radiation based on phase-matched optical rectification process pumped by 1550-nm fiber lasers.

As in prior Terahertz Technology and Applications Conferences, these papers represent a cross section of much of the research work that is being pursued in the technically challenging terahertz spectral region.

In the prior four years of the Proceedings of this conference (Conferences 6472, 6893 7215, and 7601, respectively), we (including Dr. Kurt Linden) presented a list of recent technical articles describing significant advances in the terahertz technology. This year, for the interested reader, we also include a list that points to a rather extensive and growing database on the terahertz absorption characteristics of a large number of chemicals given on the website www.thzdb.org. That website, in turn, provides links to related terahertz technology database websites as shown in Table 1.

In the last four years' introduction to SPIE Proceedings, Volumes 6472, 6893, 7215, 7601, respectively, two tables were included, one summarizing the more common terahertz radiation sources, and the other summarizing the more common terahertz detector types. For the interest of the general reader we again include these tables without updates other than to note that recent advancements in vacuum electronics BWOs coupled with solid state multipliers have now produced usable power above 2 THz and that devices such as quantum cascade lasers continue to make improvements that encroach upon established high power sources such as carbon dioxide lasers. Due to such advancements, any values listed in Tables 2 and 3 are likely to be bested by new records in a very short time period; however the sources and detectors listed in Tables 2 and 3 still comprise the majority of those used in the THz regime. Readers of this volume may send additions and enhancements to these tables so that future volumes can continue to provide readers with relevant information on the availability of terahertz sources and detectors. Such suggestions can be sent to sadwick@innosystech.com.

Table 2 Summary of common terahertz sources

THz source type	Details	Characteristics
Synchrotron	* Coherent synchrotron produces very high photon flux, including THz region	E-beam, very broadband source, limited instrument availability, very large size, 20 W pulsed
Free electron laser	* Benchtop design at Univ. Essex, UK Elec beam moves over alternate H-field regions	Tunable over entire THz region, under development 0.1 - 4.8 THz, 0.5 - 5 kW, 1 - 20 us pulses at 1 Hz
Smith-Purcell emitters	* E-beam travels over metal grating surface,	Requires vacuum, has low efficiency
Backward-wave oscillators	* Vacuum tube, requires homog H-field~10 kG "Carcinotron", room temperature, to 1.2 THz	Tunable output possible. Under development and commercially available, 10 mW power level, <1 THz
Mercury lamp	* Water cooled housing, low press. 1E-3 Torr 75-150 W lamp, broad emission	Sciencetech SPS-200,300, low power density Low-cost, used in THz spectroscopy
Optically pumped gas cell laser	* Grating-tuned CO2 laser and far-IR gas cell such as methane. Most mature laser.	> 100 mW, 0.3-10 THz, discrete lines, CW/pulsed Commercially avail - Coherent (\$400K - \$1M)
Opt pump GaAs, p-InAs, Si, ZnTe, InGaAs (fiber laser pump), Ge photoconducting (PC) switch	* Mode locked Nd:YAG or Ti:sapphire laser creates short across biased spiral antenna gap * Also As-doped Si, CO2 laser pump	Imaging apparatus produced, 0.1 to 3 THz Commercially available, CW uW range, \$50K-500K 6 THz stim emission from As, Liq He temp.
Laser-induced air plasma	* Ti-saph laser induces air plasma	Remote THz generation possible, very low power Possibility of power increase in multiple plasmas
Photomixing of near-IR lasers	* Mixing tunable Ti-sapphire laser and diode laser in LT-grown GaAs photomixer. * GaSe crystal, Nd:YAG/OPO difference freq * Single 835 nm diode laser, external cavity * Diff-freq generation with 2 monolith QCLs	Tens of nW, tunable. Requires antenna pattern Not commercial. GaP gave 480 mW @ 1.3 THz Tunable 58-3540um (5-0.1THz), 209 W pulse 1.5THz 2-freq mix& 4-wave mixing, RT, sub-nW, 0.3-4.2THz 7.6 u & 8.7 u -> 5 THz, 60 nW pulsed output
Electrically pumped Ge in H-field	* Electric field injects electrons, magnetic field splits hole levels for low-E transitions	Requires electric and magnetic fields Output up to hundreds of mW, cryogenic cooling, 1.5 ~ 4 THz
Electrically pumped Si:B or As	* Transitions between impurity levels 100 x 200 um rectangle mesas, biased	31 uW output at 8.1 THz, slightly polarized Cryogenic cooling needed
Electrically pulsed InGaAs RTD	* Harmonically generated by electrical pulses RTD integrated into slot antenna	0.6 uW, 1.02 THz harmonic from InGaAs/AIAs RTD pulsed at 300 Hz
Direct multiplied mm waves	* Multiplied to low-THz region up-multiplied from mm-wave	Low power (uW level), available (VA Diodes) Coherent, heterodyne local oscillators in astronomy
Parametric generators	* Q-switched Nd:YAG pumps MgO:LiNbO3 non-linear crystal, Phase matched GaAs, GaP	200 W pulsed power, room temp., 0.1-5 THz tunable some commercially available ~ \$30K
Quantum cascade (QC) laser	* First announced in 2002, semiconductor, AlGaAs/GaAs-based, MBE grown, 1.6 to 4 THz	Operated at mW power, and up to 164K pulsed THz not commercially available, require cryo-cooling
Josephson junction cascades	Research stage	0.4-0.85 THz, microwatts
Transistor	* InGaAs channel PHEMT with 35 nm gate * InGaAs with 12.5 nm gate, 0.845 THz	1.2 THz, development at Northrop Grumman Univ. Ill (Dec 2006)
Grating-bicoupled plasmon-FET	* GaAs based double interdigitated grating	with 1.5um laser illum., Tohoku/Hokkaido Univ.

Table 3 Summary of common terahertz radiation detectors

THz detector type	Details	Characteristics
Si bolometer	* Most sensitive (10 pW Hz ^{1/2}) THz detector at liquid He temp., slow response time	Responsivity 2E9V/W, NEP=1E-17 W/Hz ^{1/2} , 100 mK Requires liquid He dewar, commercially avail.
Superconducting hot elec bolom	* Highest sensitivity Fast (1 us) response time	Requires cooling to 0.3 K, NEP=1E-17 W/Hz ^{1/2} Commercially available, expensive, bulky
Pyroelectric detectors	* Slow response t, 220 nW sensitiv at 24 Hz Requires pulsed signals or mechanical chopper	Room temp operation, commercially available, Low cost, imagers available ~ \$10K
Schottky diodes	* ~ 1 THz cutoff frequency Fast response, but low THz sensitivity	Commercially available ((VA Diodes) with corner ref. Room temp operation, good for mixers
PC dipole antennas	* signal gen across biased spiral antenna gap Short pulsed detection only	Analogous to optically pumped THz PC switch but in detection mode. Commercially available
Antenna coupled inter-subband	* 4-terminal phototransistor, 1.6 THz	Under development UCSB
III-V HEMT & Si FET to 300K	* HEMT with 250 nm gate plasma wave-based detection	20 K, 50 mV/W at 420 GHz, still in development Univ research, Si NEP to 1E-10 W/Hz ^{1/2} at 300 K
Quantum dot photon detector	* Demo-photon counting terahertz microscopy imaging, requires 0.3 K temp, research only	Under development, 1E-19 W = 100 photons/sec, Tokyo Univ.
