SPIE

Volume 8923
Part One of Two Parts

Proceedings of SPIE 0277-786X, V. 8923

SPIE is an international society advancing an interdisciplinary approach to the science and application of light.

Micro/Nano Materials, Devices, and Systems, edited by James Friend, H. Hoe Tan, Proc. of SPIE
Vol. 8923, 892301 · © 2013 SPIE · CCC code: 0277-786X/13/\$18 · doi: 10.1117/12.2053914

Proc. of SPIE Vol. 8923 892301-1

The papers included in this volume were part of the technical conference cited on the cover and title page. Papers were selected and subject to review by the editors and conference program committee. Some conference presentations may not be available for publication. The papers published in these proceedings reflect the work and thoughts of the authors and are published herein as submitted. The publisher is not responsible for the validity of the information or for any outcomes resulting from reliance thereon.

Please use the following format to cite material from this book:

Other copying for republication, resale, advertising or promotion, or any form of systematic or multiple reproduction of any material in this book is prohibited except with permission in writing from the publisher. The CCC fee code is 0277-786X/13/\$18.00.

Printed in the United States of America.

Publication of record for individual papers is online in the SPIE Digital Library.

SPIDigitalLibrary.org

Paper Numbering: Proceedings of SPIE follow an e-First publication model, with papers published first online and then in print and on CD-ROM. Papers are published as they are submitted and meet publication criteria. A unique, consistent, permanent citation identifier (CID) number is assigned to each article at the time of the first publication. Utilization of CIDs allows articles to be fully citable as soon as they are published online, and connects the same identifier to all online, print, and electronic versions of the publication. SPIE uses a six-digit CID article numbering system in which:

- The first four digits correspond to the SPIE volume number.
- The last two digits indicate publication order within the volume using a Base 36 numbering system employing both numerals and letters. These two-number sets start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B ... 0Z, followed by 10-1Z, 20-2Z, etc.

The CID Number appears on each page of the manuscript. The complete citation is used on the first page, and an abbreviated version on subsequent pages. Numbers in the index correspond to the last two digits of the six-digit CID Number.

Contents

Part One

- xvii *Conference Committees*
- xxi *Nano-architecture: creating complex surface structures using supramolecular self-assembly of tripeptides (Invited Paper Summary) [8923-58]*
A. Mechler, R. Seoudi, La Trobe Univ. (Australia); M. P. Del Borgo, M.-I. Aguilar, P. Perlmutter, Monash Univ. (Australia)
- xxv *Synthesis and electrochemical characterization of novel MOF-reduced graphene oxide composites (Summary) [8923-95]*
P. Chakraborty Banerjee, R. Cnr, D. Lobo, M. Miansari, M. Majumder, Monash Univ. (Australia)
- xxvii *Tunable reduction and amorphisation of graphene oxide films by focused ion beam irradiation (Summary) [8923-120]*
D. E. Lobo, J. Fu, Monash Univ. (Australia); T. Gengenbach, Commonwealth Scientific and Industrial Research Organisation (Australia); M. Majumder, Monash Univ. (Australia)

FABRICATION I

- 8923 05 **Black-Si as a platform for sensing [8923-1]**
G. Gervinskas, P. Michaux, G. Seniutinas, J. S. Hartley, Swinburne Univ. of Technology (Australia); E. L. H. Mayes, RMIT Univ. (Australia); R. Verma, B. D. Gupta, Indian Institute of Technology Delhi (India); P. R. Stoddart, D. Morrish, N. F. Fahim, M. S. Hossain, Swinburne Univ. of Technology (Australia); S. Juodkazis, Swinburne Univ. of Technology (Australia) and Australian National Fabrication Facility (Australia)
- 8923 06 **Development of silicon optics for an integrated micro-optical system-on-a-chip [8923-4]**
D. C. Ng, National ICT Australia (Australia) and The Univ. of Melbourne (Australia); S. Kandasamy, Australian National Fabrication Facility (Australia); E. Skafidas, The Univ. of Melbourne (Australia)

SOLAR I

- 8923 07 **Enhanced photovoltaic performance of dye-sensitized solar cell using composite photoanode on 3D electrode [8923-5]**
C. K. Lim, Nanyang Technological Univ. (Singapore); H. Huang, A*STAR Singapore Institute of Manufacturing Technology (Singapore); M. S. Tse, O. K. Tan, Nanyang Technological Univ. (Singapore)

- 8923 08 **Mixed metal oxides for dye-sensitized solar cell using zinc titanium layered double hydroxide as precursor** [8923-6]
J. Liu, Y. Qin, L. Zhang, H. Xiao, J. Song, D. Liu, M. Leng, W. Hou, N. Du, Shandong Univ. (China)
- 8923 0A **Direct transfer of solar radiation to high temperature applications** [8923-8]
M. Rahou, J. Andrews, G. Rosengarten, RMIT Univ. (Australia)

NANOMATERIALS I

- 8923 0B **Fluorescent emission in different silicon carbide polytypes** [8923-9]
S. Castelletto, RMIT Univ. (Australia); B. C. Johnson, The Univ. of Melbourne (Australia); I. Aharonovich, Univ. of Technology Sydney (Australia); A. Parker, RMIT Univ. (Australia)
- 8923 0C **Graphene-polymer multilayer heterostructure for terahertz metamaterials** [8923-214]
Z. Xu, Monash Univ. (Australia); C. Chen, Soochow Univ. (China); S. Q. Y. Wu, B. Wang, J. Teng, A*STAR Institute of Materials Research and Engineering (Singapore); C. Zhang, Univ. of Wollongong (Australia); Q. Bao, Monash Univ. (Australia)
- 8923 0D **Density functional theory calculations of phenol-modified monolayer silicon nanosheets** [8923-11]
M. J. S. Spencer, RMIT Univ. (Australia) and La Trobe Univ. (Australia); T. Morishita, National Institute of Advanced Industrial Science and Technology (Japan); M. R. Bassett, La Trobe Univ. (Australia)

BIO I

- 8923 0F **Challenges in specificity and collection efficiency for integrated optical biosensors (Invited Paper)** [8923-13]
A. M. Armani, Mork Family Dept. of Chemical Engineering and Materials Science, The Univ. of Southern California (United States) and Mork Family Dept. of Chemical Engineering and Materials Science, The Univ. of Southern California (United States); S. Mehrabani, A. J. Maker, C. Lopez, Mork Family Dept. of Chemical Engineering and Materials Science, The Univ. of Southern California (United States); M. C. Harrison, Mork Family Dept. of Chemical Engineering and Materials Science, The Univ. of Southern California (United States)
- 8923 0I **Nanosensors for next generation drug screening** [8923-16]
S. K. Kannam, IBM Research Australia (Australia); M. T. Downton, IBM Research Collaboratory for Life Sciences-Melbourne (Australia); N. Gunn, S. C. Kim, P. R. Rogers, C. Schieber, J. S. Baldauf, IBM Research Australia (Australia); J. M. Wagner, IBM Research Collaboratory for Life Sciences-Melbourne (Australia); D. Scott, R. Bathgate, S. Skafidas, The Univ. of Melbourne (Australia); S. Harrer, IBM Research Australia (Australia)

PHOTONICS I

- 8923 OK **Third-order optical nonlinearity in BDN dye encapsulated polymer matrix induced by nanosecond laser pulses** [8923-19]
D. Mohan, P. Arya, Guru Jambheshwar Univ. of Science and Technology (India); A. Kumar, Instruments Research & Development Establishment (India)
- 8923 OM **Translation interference pattern in nano-scale precision by phase control based on spatial light modulator** [8923-21]
J. Ma, Y. Zhong, Z. Chen, Jinan Univ. (China); K. S. Wong, Hong Kong Univ. of Science and Technology (China)
- 8923 ON **Constructing microstructures using the optical trapping map of dielectric spheres** [8923-22]
M. Muradoglu, Monash Univ. (Australia)

MATERIALS I

- 8923 OO **Hydride VPE: the unexpected process for the fast growth of GaAs and GaN nanowires with record aspect ratio and polytypism-free crystalline structure (Invited Paper)** [8923-23]
Y. . André, CNRS, Institut Pascal, Univ. Blaise Pascal-Clermont II (France) and CNRS, UMR 6602 (France); A. Trassoudaine, CNRS, Institut Pascal, Univ. Blaise Pascal-Clermont II (France) and CNRS, UMR 6602 (France) and Univ. d'Auvergne Clermont-Ferrand I (France); G. Avit, K. Lekhal, M. R. Ramdani, CNRS, Institut Pascal, Univ. Blaise Pascal-Clermont II (France) and CNRS, UMR 6602 (France); C. Leroux, CNRS, Univ. du Sud Toulon-Var (France); G. Monier, C. Varenne, P. Hoggan, D. Castelluci, CNRS, Institut Pascal, Univ. Blaise Pascal-Clermont II (France) and CNRS, UMR 6602 (France); C. Bougerol, Institut NÉEL, CEA-CNRS-Univ. Joseph Fourier (France); F. Réveret, J. Leymarie, CNRS, Institut Pascal, Univ. Blaise Pascal-Clermont II (France) and CNRS, UMR 6602 (France); E. Petit, Institut de Chimie de Clermont-Ferrand, Univ. Blaise Pascal-Clermont II (France); V. Dubrovskii, St. Petersburg Academic Univ. (Russian Federation) and Ioffe Physico-Technical Institute (Russian Federation)
- 8923 OP **In situ monitoring of resistivity and carrier concentration during molecular beam epitaxy of topological insulator Bi₂Se₃** [8923-24]
J. Hellerstedt, Monash Univ. (Australia) and Univ. of Maryland, College Park (United States); J. H. Chen, D. Kim, W. G. Cullen, Univ. of Maryland, College Park (United States); C. X. Zheng, Monash Univ. (Australia); M. S. Fuhrer, Monash Univ. (Australia) and Univ. of Maryland, College Park (United States)
- 8923 OQ **Effect of compositional gradient on mechanical properties in aluminum/duralumin multi-layered clad structures** [8923-25]
H. Tsukamoto, Nagoya Institute of Technology (Japan); Y. Komiya, Nihon Univ. (Japan); H. Sato, Y. Watanabe, Nagoya Institute of Technology (Japan)
- 8923 OR **Electron spin resonance spectroscopy of high purity crystals at millikelvin temperatures** [8923-26]
W. G. Farr, D. L. Creedon, M. Goryachev, The Univ. of Western Australia (Australia); K. Benmessai, The Univ. of Western Australia (Australia) and Ctr. de Développement des Technologies Avancées (Algeria); M. E. Tobar, The Univ. of Western Australia (Australia)

- 8923 0S **Composite anode $\text{La}_{0.8}\text{Sr}_{0.2}\text{MnO}_3$ impregnated with cobalt oxide for steam electrolysis** [8923-27]
S. Li, J. Cheng, K. Xie, P. Li, Y. Wu, Hefei Univ. of Technology (China)

MICROFLUIDICS I

- 8923 0U **Small volume particulate and non-particulate sample collection for fluidic systems** [8923-29]
B. H. Cheong, Monash Univ. (Australia)

PLASMONICS I

- 8923 0Z **Simulation of the gap plasmon coupling with a quantum dot** [8923-34]
C. Perera, K. C. Vernon, Queensland Univ. of Technology (Australia)
- 8923 12 **Polarization effect and emission control in asymmetric cross-shaped slot antennas surrounded with periodic corrugations** [8923-37]
A. Djalalian-Assl, J. Cadusch, The Univ. of Melbourne (Australia); T. D. James, The Univ. of Melbourne (Australia) and Australian National Fabrication Facility (Australia); T. J. Davis, Commonwealth Scientific and Industrial Research Organisation (Australia) and Australian National Fabrication Facility (Australia); A. Roberts, The Univ. of Melbourne (Australia)

BIO II

- 8923 19 **Water-soluble benzylidene cyclopentanone photosensitizers for two-photon excited photodynamic therapy** [8923-44]
Y. Fang, Technical Institute of Physics and Chemistry (China) and Graduate Univ. of Chinese Academy of Sciences (China); H. Zhao, Chinese PLA General Hospital (China); Q. Zou, Technical Institute of Physics and Chemistry (China) and Graduate Univ. of Chinese Academy of Sciences (China); Y. Zhao, Technical Institute of Physics and Chemistry (China); Y. Gu, Chinese PLA General Hospital (China); F. Wu, Technical Institute of Physics and Chemistry (China)
- 8923 1A **Effects of laser-exposed gold nanorods on biochemical pathways of neuronal cells** [8923-45]
C. Paviolo, Swinburne Univ. of Technology (Australia); J. W. Haycock, The Univ. of Sheffield (United Kingdom); P. R. Stoddart, S. L. McArthur, Swinburne Univ. of Technology (Australia)
- 8923 1B **Influence of surface acoustic waves induced acoustic streaming on the kinetics of electrochemical reactions** [8923-46]
S. Tietze, J. Schlemmer, G. Lindner, Hochschule für angewandte Wissenschaften und Künste Coburg (Germany)
- 8923 1C **Laser measurements of bacterial endospore destruction from shock waves** [8923-47]
P. P. Lappas, RMIT Univ. (Australia); A. D. McCartt, S. D. Gates, J. B. Jeffries, R. K. Hanson, Stanford Univ. (United States)

PHOTONICS II

- 8923 1E **Characterization of optical polarization converters made by femtosecond laser writing** [8923-198]
C. J. de Jong, Swinburne Univ. of Technology (Australia) and Technische Univ. Eindhoven (Netherlands); A. Lajevardipour, Swinburne Univ. of Technology (Australia); M. Gecevičius, M. Beresna, Univ. of Southampton (United Kingdom); G. Seniutinas, G. Gervinskas, R. Buividas, Swinburne Univ. of Technology (Australia); P. G. Kazansky, Univ. of Southampton (United Kingdom); Y. Bellouard, Technische Univ. Eindhoven (Netherlands); A. H. A. Clayton, Swinburne Univ. of Technology (Australia); S. Juodkasis, Swinburne Univ. of Technology (Australia) and Australian National Fabrication Facility (Australia)
- 8923 1F **The application of carbon nanotubes in mode locked fiber laser** [8923-50]
Z. Yu, Beijing Univ. of Technology (China); Y. Wang, Xi'an Institute of Optics and Precision Mechanics (China); Y. Song, Beijing Univ. of Technology (China)
- 8923 1G **Comparison of Al₂O₃ nano-overlays deposited with magnetron sputtering and atomic layer deposition on optical fibers for sensing purposes** [8923-51]
M. Śmietana, T. Drązewski, P. Firek, Warsaw Univ. of Technology (Poland); P. Mikulic, W. J. Bock, Univ. du Québec en Outaouais (Canada)

SOLAR II

- 8923 1J **Heterogeneous nano-particle array for the realization of the hot carrier solar cell** [8923-55]
Y. Feng, S. Lin, X. Wen, P. Zhang, S. Huang, S. Shrestha, M. Green, G. Conibeer, The Univ. of New South Wales (Australia)
- 8923 1K **Solution processing of next-generation nanocrystal solar cells** [8923-56]
J. van Embden, A. S. R. Chesman, N. W. Duffy, E. Della Gaspera, J. J. Jasieniak, Commonwealth Scientific and Industrial Research Organisation (Australia)
- 8923 1L **Optical properties and electron dynamics in carbon nanodots** [8923-57]
X. Wen, S. Huang, G. Conibeer, S. Shrestha, The Univ. of New South Wales (Australia); P. Yu, Y.-R. Toh, J. Tang, Academia Sinica (Taiwan)

PLASMONICS II

- 8923 1Q **Optoplasmonics: hybridization in 3D** [8923-62]
L. Rosa, G. Gervinskas, Swinburne Univ. of Technology (Australia) and Australian National Fabrication Facility (Australia); A. Žukauskas, M. Malinauskas, Vilnius Univ. (Lithuania); E. Brasselet, Lab. Ondes et Matière d'Aquitaine, CNRS, Univ. Bordeaux 1 (France); S. Juodkasis, Swinburne Univ. of Technology (Australia) and Australian National Fabrication Facility (Australia)
- 8923 1R **Ultra-compact plasmonic nanoring laser** [8923-63]
C.-W. Lee, Q. Wang, G. Singh, A*STAR - Data Storage Institute (Singapore); S.-T. Ho, Northwestern Univ. (United States)

MEMS I

- 8923 1U **Effect of surfaces on thermoelastic damping of nano-resonators** [8923-66]
S. Dixit, M. M. Inamdar, D. N. Pawaskar, Indian Institute of Technology Bombay (India)
- 8923 1V **Cryogenic optical profilometry for the calculation of coefficient of thermal expansion in thin films** [8923-67]
K. L. Brookshire, R. Rafiei, M. Martyniuk, K. M. B. D. Silva, J. Bumgarner, R. W. Basedow, Y. Liu, L. Faraone, The Univ. of Western Australia (Australia)

PHOTONICS III

- 8923 21 **Measuring the electrical properties of semiconductor nanowires using terahertz conductivity spectroscopy (Invited Paper)** [8923-73]
H. J. Joyce, Univ. of Oxford (United Kingdom) and Univ. of Cambridge (United Kingdom); C. J. Docherty, C.-K. Yong, Univ. of Oxford (United Kingdom); J. Wong-Leung, Q. Gao, S. Paiman, H. H. Tan, C. Jagadish, The Australian National Univ. (Australia); J. Lloyd-Hughes, Univ. of Warwick (United Kingdom); L. M. Herz, M. B. Johnston, Univ. of Oxford (United Kingdom)
- 8923 22 **THz photomixer with a 40nm-wide nanoelectrode gap on low-temperature grown GaAs** [8923-75]
G. Seniutinas, G. Gervinskas, Swinburne Univ. of Technology (Australia) and Australian National Fabrication Facility (Australia); E. Constable, Univ. of Wollongong (Australia); A. Krotkus, Ctr. for Physical Sciences and Technology (Lithuania); G. Molis, Teravil Ltd. (Lithuania); G. Valušis, Ctr. for Physical Sciences and Technology (Lithuania); R. A. Lewis, Univ. of Wollongong (Australia); S. Juodkakis, Swinburne Univ. of Technology (Australia) and Australian National Fabrication Facility (Australia)
- 8923 24 **Extending device performance in photonic devices using piezoelectric properties** [8923-77]
G. E. Triplett, Univ. of Missouri-Columbia (United States)

METROLOGY/CHARACTERISATION

- 8923 25 **Sound of nano** [8923-78]
J. Aylott, M. Clark, L. Marques, F. Perez-Cota, R. J. Smith, K. F. Webb, The Univ. of Nottingham (United Kingdom)

MICROFLUIDICS II

- 8923 2B **Microfluidic devices using thiol-ene polymers** [8923-85]
S. J. M. C. Bou, A. V. Ellis, Flinders Univ. (Australia)
- 8923 2C **A microfluidic platform to study the mechano sensational properties of ion channels** [8923-86]
S. Baratchi, F. J. Tovar-Lopez, K. Khoshmanesh, M. Grace, W. Darby, P. McIntyre, A. Mitchell, RMIT Univ. (Australia)

SOLAR III

- 8923 2F **Current density enhancement in inverted nanopyramid textured crystalline silicon solar cell using gold nanoparticles** [8923-90]
S. Sivasubramaniam, D. Kumar, V. B. Golovko, M. M. Alkaisi, MacDiarmid Institute for Advanced Materials and Nanotechnology (New Zealand) and Univ. of Canterbury (New Zealand)
- 8923 2G **Ion-beam and plasma etching of a conical-pores photonic crystal for thin-film solar cell** [8923-91]
G. Gervinskas, L. Rosa, S. Juodkazis, Swinburne Univ. of Technology (Australia) and Australian National Fabrication Facility (Australia)
- 8923 2H **Growth of CZTS by co-sputtering and sulfurization for solar cell applications** [8923-92]
N. Muhunthan, O. P. Singh, V. N. Singh, CSIR - National Physical Lab. (India)
- 8923 2I **Potential of hafnium nitride for the hot carrier solar cell** [8923-93]
S. Chung, S. Shrestha, H. Xia, N. Gupta, G. Conibeer, The Univ. of New South Wales (Australia)

ELECTRONICS

- 8923 2Q **A novel single dot test structure for determining specific contact resistivity** [8923-102]
Y. Pan, A. M. Collins, A. S. Holland, RMIT Univ. (Australia)

PLASMONICS III

- 8923 2R **Plasmonics: the convergence between optics and electronics (Invited Paper)** [8923-103]
T. J. Davis, Commonwealth Scientific and Industrial Research Organisation (Australia) and Australian National Fabrication Facility (Australia)
- 8923 2S **Vanadium dioxide thickness effects on tunable optical antennas** [8923-104]
S. K. Earl, T. D. James, The Univ. of Melbourne (Australia) and Australian National Fabrication Facility (Australia); R. E. Marvel, Vanderbilt Univ. (United States); D. E. Gomez, T. J. Davis, Australian National Fabrication Facility (Australia) and Commonwealth Scientific and Industrial Research Organisation (Australia); J. G. Valentine, Vanderbilt Univ. (United States); J. C. McCallum, The Univ. of Melbourne (Australia); R. F. Haglund Jr., Vanderbilt Univ. (United States); A. Roberts, The Univ. of Melbourne (Australia)

MEMS II

- 8923 2V **A versatile instrumentation system for MEMS-based device optical characterization** [8923-108]
R. Rafiei, R. W. Basedow, K. K. M. B. D. Silva, J. T. Gurusamy, J. R. Silva Castillo, D. K. Tripathi, J. M. Dell, L. Faraone, The Univ. of Western Australia (Australia)

MICROFLUIDICS III

- 8923 2X **Buried picolitre fluidic channels in single-crystal diamond** [8923-110]
M. A. Strack, B. A. Fairchild, A. D. C. Alves, The Univ. of Melbourne (Australia); P. Senn, The Univ. of Melbourne (Australia) and Bionics Institute (Australia); B. C. Gibson, The Univ. of Melbourne (Australia) and RMIT Univ. (Australia); S. Prawer, The Univ. of Melbourne (Australia); A. D. Greentree, RMIT Univ. (Australia)
- 8923 2Y **How to fabricate robust microfluidic systems for a dollar** [8923-111]
F. Lapierre, Commonwealth Scientific and Industrial Research Organisation (Australia) and Australian National Fabrication Facility (Australia); N. R. Cameron, Durham Univ. (United Kingdom); J. Oakeshott, T. Peat, Commonwealth Scientific and Industrial Research Organisation (Australia); Y. Zhu, Commonwealth Scientific and Industrial Research Organisation (Australia), Australian National Fabrication Facility (Australia), and Swinburne Univ. of Technology (Australia)
- 8923 2Z **Modeling and fabrication of scale-like cantilever for cell capturing** [8923-112]
B. Liu, J. Fu, M. Muradoglu, Monash Univ. (Australia)
- 8923 30 **Nanoimprint lithography for microfluidics manufacturing** [8923-113]
G. Kreindl, T. Matthias, EV Group (Austria)

SOLAR IV

- 8923 34 **Plasmonic nanoparticles enhanced dye-sensitized solar cells** [8923-117]
Q. Xu, F. Liu, W. Meng, Y. Huang, Tsinghua Univ. (China)
- 8923 35 **Ageing effects on plasmonic properties for solar cell applications** [8923-118]
S. Pillai, Y. Yang, Y. Jiang, M. Green, The Univ. of New South Wales (Australia)

Part Two

NANOMATERIALS IV

- 8923 38 **New efficient p-n heterojunction of BiOI/TiO₂ nanotube arrays with enhanced visible-light photoelectrocatalytic activities** [8923-121]
J. Liu, Hefei Univ. of Technology (China) and Anhui Key Lab. of Advanced Functional Materials and Devices (China); L. Ruan, J. Hu, Hefei Univ. of Technology (China); Y. Wang, Y. Wu, Hefei Univ. of Technology (China) and Anhui Key Lab. of Advanced Functional Materials and Devices (China)
- 8923 3A **Porous CNTs/chitosan composite with lamellar structure prepared by ice-templating** [8923-123]
T. Wu, J. Yan, Dalian Univ. of Technology (China)

BIO IV

- 8923 3C **Integrated microdroplet-based system for enzyme synthesis and sampling** [8923-125]
F. Lapierre, Commonwealth Scientific and Industrial Research Organisation (Australia) and Australian National Fabrication Facility (Australia); M. Best, R. Stewart, J. Oakeshott, T. Peat, Commonwealth Scientific and Industrial Research Organisation (Australia); Y. Zhu, Commonwealth Scientific and Industrial Research Organisation (Australia), Australian National Fabrication Facility (Australia), and Swinburne Univ. of Technology (Australia)
- 8923 3D **A microfluidic device for studying cell signaling with multiple inputs and adjustable amplitudes and frequencies** [8923-126]
Z. Ningsih, J. W. M. Chon, A. H. A. Clayton, Swinburne Univ. of Technology (Australia)
- 8923 3E **Micro pore arrays in free standing cyclic olefin copolymer membranes: fabrication and surface functionalization strategies for in-vitro barrier tissue models** [8923-127]
M. Gel, Commonwealth Scientific and Industrial Research Organisation (Australia); S. Kandasamy, Australian National Fabrication Facility (Australia) and The Univ. of Melbourne (Australia); K. Cartledge, C. L. Be, D. Haylock, Commonwealth Scientific and Industrial Research Organisation (Australia)

PHOTONICS IV

- 8923 3H **Proposal of a Si based device for multiplexing conversion between PDM and MDM** [8923-130]
M. Ye, Y. Yu, L. Xiang, B. Zou, X. Zhang, D. Huang, Huazhong Univ. of Science and Technology (China)
- 8923 3J **Chiral elements and dual systems: towards the design of an omnidirectional optical active media** [8923-132]
X. Vidal, Macquarie Univ. (Australia); X. Zambrana-Puyalto, Macquarie Univ. (Australia) and ARC Ctr. for Engineered Quantum Systems (Australia); A. F. Barbara, Macquarie Univ. (Australia); I. Fernandez-Corbaton, G. Molina-Terriza, Macquarie Univ. (Australia) and ARC Ctr. for Engineered Quantum Systems (Australia)
- 8923 3K **Steady state design of photonic transistor to achieve a switching gain ≥ 3 dB** [8923-133]
V. Krishnamurthy, A*STAR - Data Storage Institute (Singapore); Y. Chen, National Univ. of Singapore (Singapore); S. T. Ho, Northwestern Univ. (United States)

MATERIALS II

- 8923 3P **Non-intrusive tunable resonant microwave cavity for optical detected magnetic resonance of NV centres in nanodiamonds** [8923-138]
J.-M. Le Floch, The Univ. of Western Australia (Australia) and ARC Ctr. of Excellence for Engineered Quantum Systems (Australia); C. Bradac, T. Volz, ARC Ctr. of Excellence for Engineered Quantum Systems (Australia) and Macquarie Univ. (Australia); M. E. Tobar, The Univ. of Western Australia (Australia) and ARC Ctr. of Excellence for Engineered Quantum Systems (Australia); S. Castelletto, RMIT Univ. (Australia)

FABRICATION III

- 8923 3Q **A fabrication method of out-of-plane stretchable and flexible electrodes based on PDMS** [8923-140]
N. Chou, S. Kim, Gwangju Institute of Science and Technology (Korea, Republic of)

PHOTONICS V

- 8923 3T **Chiral photonic crystals with four-fold symmetry: band structure and S-parameters of eight-fold intergrown Gyroid nets** [8923-143]
M. Saba, Friedrich-Alexander-Univ. Erlangen-Nürnberg (Germany); M. D. Turner, M. Gu, Swinburne Univ. of Technology (Australia); K. Mecke, G. E. Schröder-Turk, Friedrich-Alexander-Univ. Erlangen-Nürnberg (Germany)

NANOMATERIALS V

Nano-architecture: creating complex surface structures using supramolecular self-assembly of tripeptides

Adam Mechler^{*a}, Rania Seoudi, Mark P. Del Borgo^b, Marie-Isabel Aguilar^b, Patrick Perlmutter^c

Keywords: self-assembly, supramolecular recognition, artificial silk, unnatural β -peptide

ABSTRACT

Here we report on using small unnatural helical beta peptides to form higher order geometries. These peptides are known to self-assemble by supramolecular recognition, via a unique 3-point H-bonding motif. This self-assembly pattern leads to unprecedented head-to-tail self-assembly, thus continuing the intramolecular helix into a fibrous superstructure. The smallest peptide still capable of self-assembly had a sequence of only three beta amino acids. We demonstrated a hierarchical self-assembly process, which can be designed to form macroscopic silk-like threads as well as complex nanometer scale surface structures. We have achieved radial as well as parallel geometries. Both the synthesis and the derivatization of the fibres is relatively straightforward, making this platform technology ideally suited for the highly exacting requirements of materials science.

1. INTRODUCTION

Until recently, nanotechnology has been dominated by top down nanofabrication. While a plethora of bottom-up approaches have been proposed, the ability to create patterns in a spatially consistent manner is still a challenge^[1,2]. The most success has been achieved using biomaterials such as peptide amphiphiles^[3]. However, the limitations of the amphiphile self-assembly - the low specificity and selectivity of the self-assembly motif, and the dependence on an aqueous environment - still does not allow for the design of hierarchical structures. Supramolecular self-assembly offers the means to overcome the existing limitations and design new functional nanomaterials. The specificity and selectivity offered by supramolecular recognition minimizes defects, while the geometrically optimized physical bonding networks introduce high strength. In recent work^[4] we reported the design of a unique supramolecular self-assembly motif for the head-to-tail assembly of small, inherently helical unnatural beta peptides, effectively turning the self-assembled structure into a continuation of the intramolecular helix. These helices have a perfect pitch, with exactly three amino acids per turn, and thus the residues are aligned along the helix. We described how these core fibrils bundled to form microscopic and macroscopic threads. Here we describe the formation of complex geometries based on the same principle.

2. EXPERIMENTAL

MATERIALS. Spectrophotometric grade solvents were purchased from Sigma Aldrich. Peptides were synthesized as described^[4] using standard solid state synthetic methods. Beta amino acids were purchased from GL Biochem. Peptide solutions were freshly prepared in methanol, isopropanol, acetone and chloroform solvents by dissolving 1 mg of the lyophilized peptide in 1 ml of each solvent separately. The solutions were vortexed for 3 min, and then incubated for at

least 24 hr before use. Peptide solutions were drop cast onto mica surface, dried under N₂, aged overnight and imaged with AFM.

ATOMIC FORCE MICROSCOPY. Deposits were characterized using atomic force microscopy (AFM) with an Ntegra system (NT-MDT, Russia), in scan-by-sample configuration. NSG30 NT-MDT silicon cantilevers were used with a typical spring constant of 72 N m⁻¹ and a nominal tip radius of 10 nm. All samples were imaged under ambient conditions using semi-contact (tapping) mode at 512x512 pixel resolution and 0.5-1 Hz scan rate.

3. RESULTS AND DISCUSSION

The AFM images show fibrous material with a geometry that suggest a well defined one dimensional self-assembly into fibres (figure 1). It is apparent that the smaller fibres twist into consecutively larger structures in a hierarchical manner. Thus the self-assembly follows two motifs. The supramolecular self-assembly provides the fibrous core structure while adhesion between the fibres leads to the formation of branched hierarchical structures.

Figure 1 ac-βLβIβA on mica surface, imaged by AFM. The scale is 10 μm. The peptide was dissolved in methanol and mixed with isopropanol for deposition. Typical heights of fibres are 20-30 nm

In the second example, the structures have been radial in appearance (figure 2). In this case the self-assembly process was aborted by quick drying. Imaging revealed the presence of non-assembled material that has coated the surface; the layer is viscous and it causes high probe adhesion to the surface, further confirming its amorphous nature. Since the self-assembly did not proceed, here the initial stages are visible. The fibre nucleation happens simultaneously at several places, and fibre growth proceeds from these sites initially in a distorted radial geometry, forming twisted branches in a hierarchically decreasing geometry from the center outwards.

The major advantage of this process over amphiphilic self-assembly is that the two motifs are distinctly different in their specificity and selectivity, and are responsible for two different geometrical trends. Thus, while it is possible to control the geometry to some extent by the balance of hydrophobic and repulsive interactions in the case of amphiphilic self-

Figure 2 Peptides were deposited from methanol with an addition of isopropanol. Self-assembly was aborted via quick drying. The nucleation sites of fibre formation are visible as radial structures.

assembly^[5], the design presented here is superior in that a highly specific and selective supramolecular self-assembly motif provides the core structures.

4. CONCLUSIONS

Fibrous surface structures have been created using supramolecular self-assembly of small unnatural β peptides. These surface structures might be radial or parallel. The structures are based on a 3-point H-bonding motif that implements head-to-tail self-assembly, in essence a continuous helical structure, of small non-amphiphilic peptides. The structure offers itself for easy functionalization with three well-defined functional sites in a trigonal geometry. Thus it is a platform technology for applications that rely on the delivery of complex payload in a spatially controlled geometry.

Recently great interest has been drawn towards carbon materials that include graphene and similar 2D materials owing to their unique structural and physical properties¹. Graphene with its flat 2D structure possess reasonably large surface area and good electrical conductivity. These properties could specifically tune in combination with the other related materials by forming nanocomposites and thereby imparting novel as well as improved properties compared to their parent materials. Another class of materials, Metal-organic frameworks or MOFs are emerging as very interesting porous materials with extremely large internal surface area and tunable chemical properties. These materials are new generation porous crystalline materials suitably formed by the co-ordination of organic - inorganic moieties in a well-defined pattern. The organic linkers connected with metal centres provide them with extremely high surface area and ability to introduce variable functional groups. However, MOFs are generally insulators. It can be hypothesized that a combination of MOF with graphene will generate materials with large surface area and high electrical conductivity, which in turn may lead to the development of efficient supercapacitors. A few studies²⁻⁷ have investigated the MOF-carbon systems with the main focus towards materials for gas separation, gas storage and supercapacitor applications. Jahan *et al.*⁶ reported the structure directing role of reduced graphene oxide (RGO) in the synthesis of MOF5. Petit *et al.*⁷ synthesized several different novel composites based on a copper based MOF (HKUST-1) and RGO and studied the reactive adsorption of ammonia in order to characterize the mechanisms of the retention process. Guo *et al.*² reported that composites synthesized using RGO and a platinum based MOF can be modified further to perform bioanalysis, biocatalysis and environmental monitoring. However, to the authors best knowledge there has not been any study to investigate whether MOF and RGO based composite materials can be used as supercapacitors. Hence, in the present study we have synthesized MOF5 and RGO composites with varying amounts of RGO and have investigated the electrochemical responses of these materials in 1 M sodium sulphate (Na₂SO₄) electrolyte.

In this study, we have synthesized three different MOF5-RGO composites with 3%, 5% and 7% of RGO content using a DMF approach of MOF synthesis⁸. X-ray diffraction (XRD) and Raman spectra were performed to analyse the chemical nature of MOF composites. Although the XRD spectra suggested that the inherent cubical symmetry of MOF5 was absent in case of the composites containing 3% and 5% RGO, it was present in case of the composite containing 7% of RGO. This can be attributed to the fact that the higher content of RGO in the composite containing 7% of RGO maintains the cubical symmetry of MOF5 by wrapping moisture sensitive⁹ MOF surface. This was further supported by the scanning electron micrographs (SEM) of the morphology of the composites containing 7% RGO. Raman spectra of all the composites (3%, 5% and 7%) had peaks corresponding to both RGO and MOF5. The BET surface area of the composite containing 7% RGO (1400 m²/g) was about two orders of magnitude higher than the other two composites (3% and 5%). The electrical conductivity of the composite materials increased with increasing RGO content and the maximum electrical conductivity was observed in case of the composite containing 7% RGO. The electrochemical characterization of all the composites was performed in a three electrode electrochemical cell (composites were used as the working electrode, platinum mesh as the counter electrode and saturated calomel electrode as the reference electrode) in 1 M Na₂SO₄ using a Biologic VSP potentiostat. The cyclic voltametry (performed in the range of 0-0.5 V vs SCE at a scan rate of 20 mV/s) and the galvanostatic charge-discharge (performed at a constant current of 0.5 A/g in the potentials range of 0-1 V vs SCE) showed that the specific capacitance of the composite materials increased with increasing RGO content. The maximum specific capacitance was obtained in case of the composite containing 7% RGO and was about 5 times better than only RGO. The higher specific capacitance obtained in case of the composite containing 7% RGO can be attributed to the fact that this composite material had the combination of the highest surface area and the highest electrical conductivity. The cyclability of the composites was evaluated for 1000 cycles using the galvanostatic charge-

discharge experiments. The specific capacitance retention of the composite containing 7% RGO was significantly high (80%) even after 1000 cycles.

ABSTRACT

Graphene has risen to prominence as a scientifically intriguing material with tremendous potential, making its fabrication a key research area. An intriguing and innovative route to its synthesis is the use of focused ion beam irradiation to achieve spatially patterned reduction of graphene oxide. Here we explore the sensitivity of this approach, analysing the key parameter of ion fluence through a systematic study, ranging from 0-0.204 nC/ μm^2 . We characterize the regimes of preferential reduction and amorphisation, and analyzing changes in the materials bulk conductivity and Raman spectra, as it progresses through these regimes.

1. INTRODUCTION

Graphene has risen to prominence as a versatile and scientifically intriguing material with tremendous potential. Making its fabrication a key research area extensively worked on by the scientific community at large. An intriguing and innovative route to its synthesis is the spatially patterned reduction of the electrically insulating graphene oxide (GO) to the conductive reduced-graphene oxide (rGO).

This method opens up a top down fabrication approach for all-carbon based electronic devices with the ability to directly write conductive pathways into an electrically insulating material. The use of focused ion beam (FIB) irradiation to achieve this has been demonstrated¹. Here we explore the sensitivity of this approach, analysing the key parameter of ion fluence.

Presented are the results of a systematic study where the ion fluence was varied from 0-0.204 nC/ μm^2 , with analysis of Raman spectroscopy and atomic force microscopy (AFM) to determine the effect on the surface morphology of the sample. It is expected that increasing the fluence will result in the preferential reduction of the GO being overridden by amorphisation of the sample, leaving two regimes. One regime is where the major effect of ion irradiation is preferential removal of oxygen resulting in rGO, and the other is where there is an increase in damage to the sample, leading to major disruptions of the carbon lattice and hence amorphisation. If the transition between these regimes is gradual it will allow for us to tune the effect of the irradiation, a key in using the FIB for the fabrication of micro to nanoscale patterns, to suit desired application.

2. METHODOLOGY

The GO was synthesized from graphite powder (SP-1 grade 325 mesh, Bay Carbon Inc.) using a modified Hummer method. It was then used to fabricate samples via spin coating on Si to make a continuous GO film that was 80nm in thickness. The samples were then placed into the chamber of an FEI Helios Nanolab 600 FIB-SEM and pumped down to a vacuum level of below 1×10^{-3} Pa. Markers were milled into the surface using a 30 kV beam, 9.3 nA current with a fluence of 2.79 nC/ μm^2 , and the area within the markers was exposed to a controlled fluence of Ga ions ranging from 0 to 0.204 nC/ μm^2 . Raman spectra were obtained using a Renishaw Confocal micro-Raman Spectrometer equipped with a HeNe (632.8 nm) laser calibrated to the silicon peak. Two point conductivity measurements were conducted using an Agilent B2900Series Precision Source/Measure Unit wired through an EmCal Genelyte Probe Station with 5 μm tipped tungsten probes. Measurements were taken by varying the applied voltage between - 4.5 V to +4.5 V. This range was deemed acceptable as studies have shown that 0 – 30 V range is required to stimulate electrically induced reduction of GO². The probes were placed 50 μm apart. The scan rate used in the measurements was 0.8 V/s with a measurement taken every 0.008 V.

3. RESULTS AND DISCUSSION

Initial SEM images displaying the result of increasing fluence clearly show that at higher doses we have greater damage to the sample's surface as seen in figure 1 what is intriguing is the transition between these two morphologies. From the Raman spectra of the FIB exposed regions seen in figure 2 it is evident that the sample undergoes different levels of reduction and amorphisation³ as we progressively increase the dosage of ions. At the maximum fluence studied $0.204 \text{ nC}/\mu\text{m}^2$ the sample is completely amorphised as is evident for the broad resonance peak. This is also reflected in the bulk conductivity measurements taken of the samples where the conductivity drops off at higher ion fluences. Initially the conductivity is low ($5 \times 10^{-4} \text{ S/m}$) as graphene oxide is an insulating material due to the oxygen defects in its basal plane. Upon irradiation by the Ga ions (fluence $0.08 \text{ nC}/\mu\text{m}^2$) the sample is reduced and this partially restores the sp^2 honeycomb structure found in pristine graphene and hence increases its conductivity ($3 \times 10^{-1} \text{ S/m}$) by 3 orders of magnitude. Finally at higher fluence values the ions do significant damage to the structure and the amorphisation hinders the electron mobility hence reducing the conductivity⁴ once again (2.4×10^{-6}).

Figure 1. SEM images of the effect of increasing fluence on the GO sample there is an immediate change in contrast initially but it is clear that at higher fluences the surface undergoes significant damage.

Figure 2. Optical images of the exposed regions with their corresponding Raman spectra, these results show us that the sample initially undergoes reduction and then at higher ion fluences amorphisation.

4. CONCLUSIONS

This work demonstrates that the FIB irradiation of graphene oxide is highly controllable, to the point where damage to the sample can be tuned between reduction and amorphisation. The maximum conductivity was obtained with a fluence of $0.08 \text{ nC}/\mu\text{m}^2$ which lies in a region of reduction and amorphisation. This technique can be used as a tool to directly write all carbon conductive elements into an otherwise insulating film.
