Publication of record for individual papers is online in the SPIE Digital Library.

SPIDigitalLibrary.org

Paper Numbering: Proceedings of SPIE follow an e-First publication model, with papers published first online and then in print and on CD-ROM. Papers are published as they are submitted and meet publication criteria. A unique, consistent, permanent citation identifier (CID) number is assigned to each article at the time of the first publication. Utilization of CIDs allows articles to be fully citable as soon as they are published online, and connects the same identifier to all online, print, and electronic versions of the publication. SPIE uses a six-digit CID article numbering system in which:

- The first four digits correspond to the SPIE volume number.
- The last two digits indicate publication order within the volume using a Base 36 numbering system employing both numerals and letters. These two-number sets start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B ... 0Z, followed by 10-1Z, 20-2Z, etc.

The CID Number appears on each page of the manuscript. The complete citation is used on the first page, and an abbreviated version on subsequent pages. Numbers in the index correspond to the last two digits of the six-digit CID Number.

Contents

- v *Conference Committee*
- vii *Ultra-short gates improve the performance of high-speed gated single-photon avalanche diodes (Invited Paper Summary) [9114-7]*
T. Jennewein, E. Choi, B. Higgins, Univ. of Waterloo (Canada)

SUPERCONDUCTING SPDs I: FREE SPACE COMMUNICATIONS

- 9114 04 **Cryogenic SiGe integrated circuits for superconducting nanowire single photon detector readout (Invited Paper) [9114-3]**
J. C. Bardin, P. Ravindran, S.-W. Chang, C. Mohamed, R. Kumar, Univ. of Massachusetts Amherst (United States); J. A. Stern, M. D. Shaw, D. Russell, F. Marsili, G. Resta, W. H. Farr, Jet Propulsion Lab. (United States)

QUANTUM COMMUNICATIONS

- 9114 09 **Ultra-short gates improve the performance of high-speed gated single-photon avalanche diodes [9114-8]**
A. Restelli, J. C. Bienfang, A. L. Migdall, Joint Quantum Institute of National Institute of Standards and Technology and Univ. of Maryland (United States)

SINGLE-PHOTON IMAGING AND PHOTON-COUNTING ARRAYS

- 9114 0B **Photon-sparse heralded imaging (Invited Paper) [9114-10]**
P. A. Morris, R. S. Aspden, J. Bell, Univ. of Glasgow (United Kingdom); D. S. Tasca, Federal Univ. of Rio de Janeiro (Brazil); R. W. Boyd, Univ. of Glasgow (United Kingdom), Univ. of Rochester (United States), and Univ. of Ottawa (Canada); M. J. Padgett, Univ. of Glasgow (United Kingdom)
- 9114 0C **Low-noise CMOS SPAD arrays with in-pixel time-to-digital converters (Invited Paper) [9114-11]**
A. Tosi, F. Villa, D. Bronzi, Y. Zou, R. Lussana, D. Tamborini, Politecnico di Milano (Italy); S. Tisa, Micro Photon Devices S.r.l. (Italy); D. Durini, S. Weyers, U. Pashen, W. Brockherde, Fraunhofer-Institut für Mikroelektronische Schaltungen und Systeme (Germany); F. Zappa, Politecnico di Milano (Italy)
- 9114 0D **Evaluation of GM-APD array devices for low-light-level imaging [9114-12]**
K. Kolb, B. Hanold, J. Lee, D. F. Figer, Rochester Institute of Technology (United States)
- 9114 0F **SWIR Geiger-mode APD detectors and cameras for 3D imaging [9114-14]**
M. A. Itzler, M. Entwistle, U. Krishnamachari, M. Owens, X. Jiang, K. Slomkowski, S. Rangwala, Princeton Lightwave, Inc. (United States)

SINGLE-PHOTON LIDAR

- 9114 0G **Advanced 3D imaging lidar concepts for long range sensing (Invited Paper)** [9114-15]
K. J. Gordon, P. A. Hiskett, R. A. Lamb, SELEX ES Ltd. (United Kingdom)
- 9114 0H **Moderate to high altitude, single photon sensitive, 3D imaging lidars** [9114-16]
J. J. Degnan, C. T. Field, Sigma Space Corp. (United States)
- 9114 0I **Long range 3D imaging with a 32×32 Geiger mode InGaAs/InP camera** [9114-17]
P. A. Hiskett, K. J. Gordon, J. W. Copley, R. A. Lamb, SELEX ES Ltd. (United Kingdom)
- 9114 0K **HgCdTe e-APD detector arrays with single photon sensitivity for space lidar applications** [9114-19]
X. Sun, J. B. Abshire, NASA Goddard Space Flight Ctr. (United States); J. D. Beck, DRS RSTA, Inc. (United States)

SOLID-STATE PHOTOMULTIPLIERS

- 9114 0N **Study of silicon photomultipliers and applications** [9114-22]
N. D'Ascenzo, V. Saveliev, Institute of Applied Mathematics (Russian Federation), Huazhong Univ. of Science and Technology (China) and Deutsches Elektronen-Synchrotron (Germany); L. Wang, D. Xi, Q. Xie, Huazhong Univ. of Science and Technology (China)
- 9114 0O **Low temperature performance of free-running InGaAs/InP single-photon negative feedback avalanche diodes (Invited Paper)** [9114-23]
B. Korzh, H. Zbinden, Univ. de Genève (Switzerland)

VISIBLE AND UV SINGLE-PHOTON COMMUNICATIONS

- 9114 0P **Underwater optical communications with a single photon-counting system** [9114-24]
P. A. Hiskett, R. A. Lamb, SELEX ES Ltd. (United Kingdom)
- 9114 0Q **Receiver dead time in non-line-of-sight ultraviolet communications** [9114-26]
R. J. Drost, P. L. Yu, U.S. Army Research Lab. (United States); G. Chen, Univ. of California, Riverside (United States); B. M. Sadler, U.S. Army Research Lab. (United States)

Progress towards implementation of a quantum communication receiver satellite

T. Jennewein, E. Choi, B. Higgins

Institute for Quantum Computing and the Department of Physics and Astronomy
University of Waterloo, 200 University Ave. W, Canada N2L 3G1

The secure distribution of cryptographic keys has always been a crucial element for the task of protecting and sharing important secrets. Today's algorithmic key distribution makes assumptions on the computing power of a possible hacker, which leads to fundamental problems for long-term security. Quantum key distribution (QKD) establishes highly secure keys between distant parties by using single photons to transmit each bit of the key. Since single photons behave according to the laws of quantum mechanics they cannot be tapped, copied or directly measured without disturbance. The huge benefit for users of such systems is the peace of mind of knowing that any attack, manipulation or copying of the photons can be immediately detected and overcome. QKD solves the long-standing problem of securely transporting cryptographic keys between distant locations. Even if they were to be transmitted across hostile territory, their integrity could be unambiguously verified upon receipt.

Ground-based QKD systems are commercially available today. However, these current systems can only cover distances of up to 200 km due to photon absorption in fiber optic cables. In principle, quantum repeaters would allow the concatenation of several shorter quantum links and thereby overcome the limitations of direct long-distance quantum transmissions, and much research is devoted to solving technical hurdles that prevent deployment of these devices outside laboratory settings. Satellite-based quantum communication systems, however offer an approach for surpassing distance limitations even with today's technology, and a truly global network for quantum communication becomes feasible in the near-term (Figure 1).

Figure 1: A satellite can be used as a trusted node to bridge the large distance gap between two city-wide networks.

Over the past three years, our group has been working with industry partners to advance a proposed microsatellite mission called QEYSSat (Quantum EncrYption and Science Satellite) through a series of conceptual and technical studies funded primarily by the Canadian Space Agency (CSA) [1]. QEYSSat's mission objectives are to demonstrate the generation of encryption keys through the creation of quantum links between ground and space, and also to conduct fundamental science tests of long-distance quantum entanglement [2].

The quantum signals are generated in photon sources located on the ground. An optical transmitter on the ground will point the beam of photons towards the satellite. One important aspect of this mission concept is to keep the

complex source technologies on the ground and ensure the satellite is simple and cost-effective. It also allows the quantum link to be implemented using various different types of quantum sources, including entangled photons and weak coherent pulses. Placing the quantum receiver in space, however, poses some additional technical challenges. The expected link losses will be higher for the uplink than for a downlink. In addition, the dark counts of single-photon detectors will rise due to radiation exposure in orbit.

The current platform for the QEYSSat mission proposal is based on a microsatellite, to be located in a low Earth orbit (LEO) at an altitude of approximately 600 km. The payload would have an optical receiver with 40 cm aperture as the main optics (Figure 2). In order to show the viability of this mission concept, we have conducted several theoretical and experimental studies including a comprehensive link performance analysis, QKD experiments over high transmission losses and over a rapidly fluctuating channel.

We are currently working on the main technical challenges, which are to advance existing quantum devices to make them suitable for the space environment. The QEYSSat payload will include the capability to analyze and detect single optical photons with high efficiency and accuracy, and is aimed for a micro-satellite platform. In addition, we have considered the feasibility of nano-satellites, which could serve as an interesting technology demonstrator mission. The underlying principle of such payloads is that all arriving photon are analyzed in a polarization analyzer and detected in single-photon detectors. Onboard data acquisition will register all detection events and record their time-stamps to sub-nanosecond precision, which will be processed at a later time on the ground. We are leading a project with industry partners and the CSA to build and test a compact prototype for the main elements of the quantum key distribution receiver (QKDR) that would be compatible with a microsatellite-class platform.

Figure 2: Left: Artist's rendering of a quantum communications link between a ground station and the satellite. Right: CAD drawing of the proposed QEYSSat spacecraft.

ACKNOWLEDGMENTS

This work is currently supported by the Canadian Space Agency (CSA), FedDev Ontario, NSERC, CIFAR, CFI Innovation Fund, Ontario Government MEDI ORF and ERA. An initial quantum microsatellite mission feasibility study had been funded by Defense Research and Development Canada (DRDC).
