Proceedings of SPIE 0277-786X, V. 9358

SPIE is an international society advancing an interdisciplinary approach to the science and application of light.

Physics, Simulation, and Photonic Engineering of Photovoltaic Devices IV, edited by Alexandre Freundlich, Jean-François Guillemoles, Masakazu Sugiyama, Proc. of SPIE Vol. 9358, 935801 · © 2015 SPIE
CCC code: 0277-786X/15/\$18 · doi: 10.1117/12.2191542

Proc. of SPIE Vol. 9358 935801-1

The papers included in this volume were part of the technical conference cited on the cover and title page. Papers were selected and subject to review by the editors and conference program committee. Some conference presentations may not be available for publication. The papers published in these proceedings reflect the work and thoughts of the authors and are published herein as submitted. The publisher is not responsible for the validity of the information or for any outcomes resulting from reliance thereon.

Publication of record for individual papers is online in the SPIE Digital Library.

SPIDigitalLibrary.org

Paper Numbering: Proceedings of SPIE follow an e-First publication model, with papers published first online and then in print. Papers are published as they are submitted and meet publication criteria. A unique citation identifier (CID) number is assigned to each article at the time of the first publication. Utilization of CIDs allows articles to be fully citable as soon as they are published online, and connects the same identifier to all online, print, and electronic versions of the publication. SPIE uses a six-digit CID article numbering system in which:

- The first four digits correspond to the SPIE volume number.
- The last two digits indicate publication order within the volume using a Base 36 numbering system employing both numerals and letters. These two-number sets start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B ... 0Z, followed by 10-1Z, 20-2Z, etc.

The CID Number appears on each page of the manuscript. The complete citation is used on the first page, and an abbreviated version on subsequent pages.

Contents

vii	<i>Authors</i>
ix	<i>Conference Committee</i>
xi	<i>Introduction</i>

SESSION 1 PLASMONICS FOR SUB-WAVELENGTH LIGHT TRAPPING

9358 03	Exploring the effective absorption length of Si nanohole array for photovoltaic by plasmonic enhanced Raman scattering [9358-2]
9358 04	Sufficient condition for perfect antireflection by optical resonance at dielectric interface [9358-3]

SESSION 2 ADVANCED LIGHT MANAGEMENT FOR SI CELLS

9358 08	Design of nano-pattern reflectors for thin-film solar cells based on three-dimensional optical and electrical modeling [9358-7]
9358 09	Angle selective light management in photovoltaics using self-assembled anodized aluminum oxide nanopatterns [9358-8]

SESSION 3 ADVANCED LIGHT MANAGEMENT FOR III-V AND MULTI-JUNCTION CELLS

9358 0A	Impact of photon recycling and luminescence coupling in III-V photovoltaic devices (Invited Paper) [9358-9]
9358 0B	Multi-junction-solar-cell designs and characterizations based on detailed-balance principle and luminescence yields (Invited Paper) [9358-10]
9358 0C	Design and development of back reflectors for improved light coupling and absorption enhancement in thin MQW solar cells [9358-11]

SESSION 4 INNOVATIVE CONCENTRATOR DESIGN

9358 0E	Five-volt vertically-stacked, single-cell GaAs photonic power converter (Invited Paper) [9358-13]
9358 0G	Demonstration of a 5x5 cm² self-tracking solar concentrator [9358-15]

SESSION 5	GROWTH OF III-V ALLOYS AND NANOSTRUCTURES
9358 0H	GaAsPN-based PIN solar cells MBE-grown on GaP substrates: toward the III-V/Si tandem solar cell (Invited Paper) [9358-16]
9358 0I	Time-resolved PL and TEM studies of MOVPE-grown bulk dilute nitride and bismide quantum well heterostructure [9358-17]
9358 0J	Stacked GaAs(Sb)(N)-capped InAs/GaAs quantum dots for enhanced solar cell efficiency [9358-18]
9358 0K	Modeling <i>nipi</i> solar cells under concentration accounting for state filling effects [9358-19]
SESSION 6	CHARACTERIZATION AND TRANSPORT PROPERTIES
9358 0M	Optoelectronic characterization of polycrystalline solar cells using time-resolved biased luminescence techniques [9358-21]
9358 0N	Numerical modeling of radiation effects in Si solar cell for space [9358-22]
9358 0O	Transient lateral photovoltaic effect in patterned ferromagnetic metal-oxide-semiconductor films [9358-23]
SESSION 7	SOLAR CELL SIMULATION: JOINT SESSION WITH CONFERENCES 9357 AND 9358
9358 0Q	Radiative dark current in optically thin III-V photovoltaic devices [9358-47]
SESSION 8	HYBRID AND NANOWIRE MATERIALS FOR SOLAR ENERGY CONVERSION
9358 0S	Optimization of the fabricated silicon nanowires for energy-harvesting applications [9358-27]
9358 0T	Study of the Förster resonance energy transfer in composite films of carbon nanotubes [9358-28]
SESSION 9	ADVANCED PHOTOVOLTAIC CONCEPTS: IBSC
9358 0V	Extreme broadband photocurrent spectroscopy on InAs quantum dot solar cells [9358-30]
9358 0X	Suppression of thermal carrier escape and enhanced two-step photon absorption in quantum-dot intermediate-band solar cells with a high-potential barrier [9358-32]
9358 0Y	Investigation of carrier collection in multi-quantum well solar cells by luminescence spectra analysis [9358-33]

SESSION 10 ADVANCED PHOTOVOLTAIC CONCEPTS: HOT CARRIERS

- 9358 0Z **Evidence of hot carriers at elevated temperatures in InAs/AlAs_{0.84}Sb_{0.16} quantum wells (Invited Paper) [9358-34]**
- 9358 10 **A metallic hot carrier photovoltaic cell [9358-35]**
- 9358 11 **Above and below band edge light recovery with plasmonics (Green Photonics Award for Renewable Energy Generation) [9358-36]**

SESSION 11 ADVANCED PHOTOVOLTAIC CONCEPTS: PHOTON CONVERSION AND SPECTRAL SHAPING

- 9358 14 **Radiative cooling for solar cells [9358-39]**
- 9358 16 **GaSb thermophotovoltaics: current challenges and solutions [9358-41]**

POSTER SESSION

- 9358 17 **Hybrid multi-junction silicon solar cell simulation [9358-42]**
- 9358 18 **The durability of the dye-sensitized solar cell with silicon resin [9358-43]**
- 9358 19 **Density-controlled ZnO/TiO₂ nanocomposite photoanode for improving dye-sensitized solar cells performance [9358-44]**
- 9358 1A **High excitation photoluminescence effects as a probing tool for the growth of Cu(In,Ga)Se₂ [9358-45]**
- 9358 1B **Laser-assisted manufacturing of micro-optical volume elements for enhancing the amount of light absorbed by solar cells in photovoltaic modules [9358-46]**

Authors

Numbers in the index correspond to the last two digits of the six-digit citation identifier (CID) article numbering system used in Proceedings of SPIE. The first four digits reflect the volume number. Base 36 numbering is employed for the last two digits and indicates the order of articles within the volume. Numbers start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B...0Z, followed by 10-1Z, 20-2Z, etc.

Conference Committee

Symposium Chairs

David L. Andrews, University of East Anglia (United Kingdom)
Alexei L. Glebov, OptiGrate Corporation (United States)

Symposium Co-chairs

Jean-Emmanuel Broquin, IMEP-LAHC (France)
Shibin Jiang, AdValue Photonics, Inc. (United States)

Program Track Chair

James G. Grote, Air Force Research Laboratory (United States)

Conference Chairs

Alexandre Freundlich, University of Houston (United States)
Jean-François Guillemoles, Institut de Recherche et Développement
sur l'Energie Photovoltaïque (France)
Masakazu Sugiyama, The University of Tokyo (Japan)

Conference Program Committee

Harry A. Atwater Jr., California Institute of Technology (United States)
Kylie R. Catchpole, The Australian National University (Australia)
Gavin Conibeer, The University of New South Wales (Australia)
Nicholas J. Ekins-Daukes, Imperial College London (United Kingdom)
Louise C. Hirst, U.S. Naval Research Laboratory (United States)
Christiana B. Honsberg, Arizona State University (United States)
Seth M. Hubbard, Rochester Institute of Technology (United States)
Laurent Lombez, Institut de Recherche et Développement sur
l'Energie Photovoltaïque (France)
Antonio Marti Vega, Universidad Politécnica de Madrid (Spain)
Marek Osiński, The University of New Mexico (United States)
Robert J. Walters, U.S. Naval Research Laboratory (United States)
David M. Wilt, Air Force Research Laboratory (United States)
Peichen Yu, National Chiao Tung University (Taiwan)

Session Chairs

- 1 Plasmonics for Sub-Wavelength Light Trapping
Seth M. Hubbard, Rochester Institute of Technology (United States)
Alexandre Freundlich, University of Houston (United States)

- 2 Advanced Light Management for Si Cells
Stéphane Collin, Laboratoire de Photonique et de Nanostructures
(France)
Ian R. Sellers, The University of Oklahoma (United States)
- 3 Advanced Light Management for III-V and Multi-Junction Cells
Olivier Durand, Institut National des Sciences Appliquées de Rennes
(France)
- 4 Innovative Concentrator Design
Arno H. M. Smets, Technische Universiteit Delft (Netherlands)
- 5 Growth of III-V Alloys and Nanostructures
Seth M. Hubbard, Rochester Institute of Technology (United States)
- 6 Characterization and Transport Properties
Karin Hinzer, University of Ottawa (Canada)
- 7 Solar Cell Simulation: Joint Session with Conferences 9357 and 9358
Bernd Witzigmann, Universität Kassel (Germany)
Alexandre Freundlich, University of Houston (United States)
- 8 Hybrid and Nanowire Materials for Solar Energy Conversion
Ryo Tamaki, The University of Tokyo (Japan)
Aude Berbezier, Forschungszentrum Jülich GmbH (Germany)
- 9 Advanced Photovoltaic Concepts: IBSC
Ian R. Sellers, The University of Oklahoma (United States)
- 10 Advanced Photovoltaic Concepts: Hot Carriers
Roger E. Welser, Magnolia Optical Technologies, Inc. (United States)
Amaury Delamarre, The University of Tokyo (Japan)
- 11 Advanced Photovoltaic Concepts: Photon Conversion and Spectral
Shaping
Laurent Lombez, Institut de Recherche et Développement sur
l'Energie Photovoltaïque (France)

Introduction

The conference on Physics, Simulation, and Photonic Engineering of Photovoltaic Devices, the fourth of its kind, held 3–6 February 2014 in the Moscone Center in San Francisco, was once again a success and attracted a lively crowd. The conference was divided in 11 sessions (including one joint with the conference on Physics and Simulation of Optoelectronic Devices XXIII) and a poster session, totaling 46 contributions in the following topics: Plasmonics for Sub-Wavelength Light Trapping, Advanced Light Management for Si Cells, Advanced Light Management for III-V and Multi-Junction Cells, Innovative Concentrator Design, Growth of III-V Alloys and Nanostructures, Characterization and Transport Properties, Solar Cell Simulation (Joint Session with Conferences 9357 and 9358), Hybrid and Nanowire Materials for Solar Energy Conversion, and three sessions on Advanced Photovoltaic Concepts: IBSC, Hot Carriers, and Photon Conversion and Spectral Shaping. All these topics are well represented in this volume.

Several presentations on subwavelength light trapping confirmed that the field is not only a source of fundamental concepts as was shown by S. Collin (LPN, France) with a new paradigm based on multi-resonant absorption and K. X. Wang (Stanford, United States) with the condition for perfect antireflection by optical resonance at dielectric interface on the possibility to go beyond the Yablonovitch limit on light trapping, but also an emerging engineering concept, as shown by the numerical surface texture optimization presented by V. Ganapati (MIT, United States) and Z. W. Pei (NCHU, Taiwan) exploring the effective absorption length of Si nanohole arrays. More conventional light trapping, but nevertheless still a very active and practical research direction, was also presented, and especially, the paper presented by A. Smets (U. Delft, Netherlands) could summarize how far the field has gone with the example of thin film silicon solar cells, while further examples were given by Yunaee Cho (Ewha Womans Univ. Korea), Hui-Hsin Hsiao (NTU, Taiwan), and B. Roberts (U. Michigan, United States). W. Wang (U. Huston, United States) and P. Y. Yu (NCTU, Taiwan) gave examples related to III-V with, respectively, the design and development of back reflectors and the use of selective filters. Finally, light trapping combined with the remarkable improvement of photovoltaic materials has the consequence that photon recycling is becoming an important issue, as outlined by A. W. Walker (ISE, Germany) and H. Akiyama (U. Tokyo) when characterizing multijunction cells. The level of performance achieved makes power converters using PV devices practically implementable as was presented by K. Hinzer (U. Ottawa, Canada). In the concentrator design session, the progresses made with a demonstration of a 5x5 cm² self-tracking solar concentrator were presented by Volker Zagolla (EPFL, Switzerland).

Achieving a high level of performance depends not only on excellent light trapping, but also on perfectly controlled material growth. This aspect was well

represented by several contributions on dilute nitride materials that are important for a full coverage of the solar spectrum: O. Durand (FOTON, France) presented on the monolithic integration of GaAsPN dilute-nitride compounds on silicon substrates; Y.K. Sin (Aerospace Corp., United States) presented "Time-resolved PL and TEM studies of MOVPE-grown bulk dilute nitride and bismide quantum well heterostructure," and A.D. Utrilla (UPM, Spain) presented on stacked GaAs(Sb)(N)-capped InAs/GaAs quantum dots, for their use in nanostructured devices. M. A. Slocum (RIT, United States) presented a n-i-p-i structure that mitigates the losses when materials have an intrinsically low performance, as for instance after degradation by space radiation. Alternatively, very thin silicon cells can also be used to this effect, as shown by K. Fedoseyev (CFD Research Corp., United States). These aspects were completed by a session on materials and device characterization, studying carrier capture and escape (Seth Hubbard, RIT, United States) or defect metastability by TRPL (G. El Hajje, IRDEP, France) and on the investigation of carrier collection in multi-quantum well solar cells by luminescence spectra analysis by Amaury Delamarre, (The Univ. of Tokyo, Japan). Finally, a session on device modeling presented how progress can be made towards innovative architectures, whether nanostructured devices (A. Di Carlo, Tor Vergata, Italy), using transport in QDots (A. Berbezier, Julich, Germany) or thinned devices (R. E. Welser, Magnolia Inc., United States).

The last day was devoted to new photovoltaic conversion concepts, exploring the possibility of enhanced photovoltaic conversion performance, beyond Shockley Queisser. A first session discussed the intermediate band solar cell concept. Much of the session was turned toward understanding the intricate multiphoton processes, and the competition with thermal escape, as in the talk on broadband photocurrent spectroscopy on InAs quantum dot solar cell by Ryo Tamaki (The Univ. of Tokyo, Japan); as well as the presentation on characterization of a AlAsSb/InAlAs heterojunction emitter design for InAs/AlAsSb quantum-dot intermediate-band solar cell by Zachary S. Bittner, (RIT, United States); and on the possibility of suppression of thermal carrier escape and enhanced two-step photon absorption in quantum-dot intermediate-band solar cells by Shigeo Asahi, (Kobe Univ., Japan).

A second session presented progresses and new directions in hot carrier solar cells. First, evidence of hot carriers at elevated temperatures in InAs/AlAs_{0.84}Sb_{0.16} quantum wells was shown by Ian R. Sellers (Univ. of Oklahoma, United States), a promising new material system working under rather low illumination intensities. Then, an important emerging approach based on the excitation of hot electrons in metals that was abundantly discussed by several contributions. Notably, James A. R. Dimmock, (Sharp Labs. of Europe Ltd., United Kingdom) showed hot carriers thermionic emission from Cr into GaAs, while Scott K. Cushing, (West Virginia Univ., United States) studied experimentally and theoretically injection of hot electrons from plasmon excitation in metals. Golam I. Hossain, (Univ. of California, Santa Cruz, United States) closed the session with a detailed fundamental study

of the phenomena. All papers gave an overview of the field with its potential and limitations.

The last session devoted to photon conversion processes, using selective emitters, showing how these could be used for radiative cooling of solar cells (Linxiao Zhu, Stanford Univ., United States), thereby increasing the power yield of solar cells, or for a more efficient use of the solar spectrum either with thermal emitters as with GaSb thermophotovoltaics featuring on chip developments (Nassim Rahimi, Virginia Polytechnic Institute and State Univ., United States) or photothermal emitters as in thermally enhanced photoluminescence, as presented by Assaf Manor (Technion-IIT, Israel).

The scientific committee, and especially some of its most active members, are to be thanked for helping shaping an exceptional program, and we are also grateful to the invited speakers that made outstanding presentations. We are glad that most of the presentations made at the symposium can be found in the present volume.

In the field of photovoltaics, this conference is like no other, with its strong side on theory and simulation, whether on materials, photovoltaic devices or photonics. It is also a place where physics and engineering mingle well. The reader will check that the present volume of collected papers reflects these aspects.
