Paper Numbering: Proceedings of SPIE follow an e-First publication model, with papers published first online and then in print. Papers are published as they are submitted and meet publication criteria. A unique citation identifier (CID) number is assigned to each article at the time of the first publication. Utilization of CIDs allows articles to be fully citable as soon as they are published online, and connects the same identifier to all online, print, and electronic versions of the publication. SPIE uses a six-digit CID article numbering system in which:

- The first four digits correspond to the SPIE volume number.
- The last two digits indicate publication order within the volume using a Base 36 numbering system employing both numerals and letters. These two-number sets start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B ... 0Z, followed by 10-1Z, 20-2Z, etc.

The CID Number appears on each page of the manuscript. The complete citation is used on the first page, and an abbreviated version on subsequent pages.

Contents

vii	<i>Authors</i>
ix	<i>Conference Committee</i>
xi	<i>Abstracts from the "Dark Side" session</i>

SESSION 1 DISPLAYS AND CAMERA

9395 02	Optimizing color fidelity for display devices using vectorized interpolation steered locally by perceptual error quantities [9395-1]
9395 03	Demosaicking algorithm for the Kodak-RGBW color filter array [9395-2]
9395 04	Subjective comparison of brightness preservation methods for local backlight dimming displays [9395-3]
9395 05	Shading correction of camera captured document image with depth map information [9395-4]

SESSION 2 PROCESSING

9395 06	A robust segmentation of scanned documents [9395-5]
9395 07	Text line detection based on cost optimized local text line direction estimation [9395-6]
9395 08	Color image enhancement based on particle swarm optimization with Gaussian mixture [9395-7]
9395 09	Image enhancement for low resolution display panels [9395-8]
9395 0A	Video enhancement method with color-protection post-processing [9395-9]
9395 0B	Fast algorithm for visibility enhancement of the images with low local contrast [9395-10]
9395 0C	Online image classification under monotonic decision boundary constraint [9395-11]

SESSION 3 HALFTONE AND PRINTING

9395 0D	An evaluation of the transferability of Munsell's colour notation methodology to modern inkjet printing technology [9395-12]
9395 0E	Effect of ink spreading and ink amount on the accuracy of the Yule-Nielsen modified spectral Neugebauer model [9395-13]

- 9395 OF **The precise prediction model of spectral reflectance for color halftone images** [9395-14]
- 9395 OH **Yule-Nielsen based multi-angle reflectance prediction of metallic halftones** [9395-16]
- 9395 OI **Multichannel DBS halftoning for improved texture quality** [9395-17]
- 9395 OJ **Color dithering methods for LEGO-like 3D printing** [9395-18]
- 9395 OK **Design of irregular screen sets that generate maximally smooth halftone patterns** [9395-19]

SESSION 4 APPLIED COLOR

- 9395 OL **Introducing iccMAX: new frontiers in color management** [9395-20]
- 9395 OM **Baseline gamut mapping method for the perceptual reference medium gamut** [9395-22]
- 9395 ON **False-colour palette generation using a reference colour gamut** [9395-23]
- 9395 OO **Color correction using 3D multi-view geometry** [9395-24]
- 9395 OQ **Vague color image enhancement on fractional differential and improved retinex** [9395-26]

SESSION 5 COLOR IN NEW TECHNOLOGIES FROM MOBILE TO CINEMA: JOINT SESSION WITH CONFERENCES 9394 AND 9395

- 9395 OT **A comparative study of psychophysical judgment of color reproductions on mobile displays between Europeans and Asians** [9395-30]
- 9395 OU **Perceived image quality assessment for color images on mobile displays** [9395-31]

SESSION 6 APPEARANCE OF COLOR

- 9395 OV **Illumination estimation based on estimation of dominant chromaticity in nonnegative matrix factorization with sparseness constraint** [9395-32]
- 9395 OW **Clarifying color category border according to color vision** [9395-33]
- 9395 OX **Investigation of the Helmholtz-Kohlrausch effect using wide-gamut display** [9395-34]
- 9395 OY **Preferred tone curve characteristics of transparent display under various viewing conditions** [9395-35]
- 9395 OZ **A method for estimating colors of scene illuminants under spatially non-uniform environments** [9395-36]

SESSION 7 DARK SIDE

- 9395 10 **How colorful! A feature it is, isn't it?** [9395-37]
- 9395 11 **Why simulations of colour for CVD observers might not be what they seem** [9395-38]

SESSION 8 COLOR DEFICIENCY

- 9395 12 **An interactive app for color deficient viewers** [9395-39]
- 9395 13 **Evaluating color deficiency simulation and daltonization methods through visual search and sample-to-match: SaMSEM and ViSDem** [9395-40]
- 9395 14 **Image color reduction method for color-defective observers using a color palette composed of 20 particular colors** [9395-41]
- 9395 15 **Adaptive color rendering of maps for users with color vision deficiencies** [9395-42]
- 9395 16 **Spatial Intensity Channel Replacement Daltonization (SiCharDa)** [9395-43]
- 9395 17 **Preferred memory color difference between the deuteranomalous and normal color vision** [9395-44]

INTERACTIVE PAPER SESSION

- 9395 18 **Representation of chromatic distribution for lighting system** [9395-45]

Authors

Numbers in the index correspond to the last two digits of the six-digit citation identifier (CID) article numbering system used in Proceedings of SPIE. The first four digits reflect the volume number. Base 36 numbering is employed for the last two digits and indicates the order of articles within the volume. Numbers start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B...0Z, followed by 10-1Z, 20-2Z, etc.

ABSTRACT

This year, at Electronic Imaging 2015, as part of the "Color Imaging XX: Displaying, Processing, Hardcopy, and Applications" conference, we hold the seventh annual special session entitled, "The Dark Side of Color". This session aims at introducing innovative thinking, opening discussion from experts working in a wide range of disciplines related with color, fostering ideas and stimulating ongoing issues and revealing common misunderstanding in color science and technology. It is comprised of a limited number of invited short presentations that are presented as summaries in this paper together with an overall description of the session point of view.

Keywords: Dark side of color, Color, Color models, Color teaching, Colorimetry, Vision, Color related phenomena

1. WHAT THIS SESSION IS ABOUT

Color is a very complex phenomenon that cannot sufficiently be explained using only simple physical principles. Instead, a more holistic approach incorporating the human vision system of eye and brain is needed to understand how the base physical stimuli are transformed into the visual colors we see.

Color related topics are often taught and communicated without presenting their inner complexity, their limits and the simplifications that generally are taken at some point. Dealing with color is usually reduced to the automatic and repetitive use of pre-defined "recipes" and this can lead to the risk of losing the overall framework and consequently a correct understanding of the technique to use.

Classic colorimetric methods, specifically designed to deal with color in aperture mode (isolated, out of visual context), have become dominant in digital color science and technology. Their use has been extended to deal with a great variety of situations in which color is considered within a visual context, thus outside of its initial scope. As such, the aperture approach has been very successful in describing a vast number of color effects. However, in some cases, an extension of the aperture view seems problematic, since the context plays a major role. Color science is facing this transitional evolution in order to deal with color in context and appearance, but without substantial changes in their original foundation.

There is a need for widening the scientific debate and discuss about paradigms. This can be achieved by, for example, new questions, different attention for details; information in the margins that so far are often discounted or overlooked. These aspects are what we consider to be the "dark side of color".

The invited speakers of this session have been asked to stimulate ideas and discussions on the needs and the characteristics of possible alternative approaches and/or point of view. This session aims at suggesting paradigm shifts, lateral thinking and bottom up experimentation by re-addressing the current state of the evolving situation in color in sciences, arts and technologies.

Following these principles, every speaker has chosen a topic of his/her preference and presents open issues and problems in a short 15-minutes presentation. The presentation abstracts are reported in the following paper to give the reader a glance on the discussed topics.

We would like to stress that basically no answers are expected to arise from the presentations of this session, but more likely questions and perspective shifts.

2. THE SPEAKERS

Here are the abstracts of the speakers that will participate at this Dark Side of Color session. The last presentation will be introductory to the special session about new perspectives on color deficiency.

2.1 “How colorful! - A feature it is, isn’t it?” Fritz Lebowsky, ST Microelectronics (France)

A display’s color subpixel geometry provides an intriguing opportunity for improving readability of text. True type fonts can be positioned at the precision of subpixel resolution. With such a constraint in mind, how does one need to design font characteristics? On the other hand, display manufacturers try hard in addressing the color display’s dilemma: smaller pixel pitch and larger display diagonals strongly increase the total number of pixels. Consequently, cost of column and row drivers as well a power consumption increase. Perceptual color subpixel rendering using color component subsampling may save about 1/3 of color subpixels (and reduce power dissipation). This talk will try to elaborate the following questions, based on simulation of several different layouts of subpixel matrices: Up to what level are display device constraints compatible with software specific ideas of rendering text? Can simplified models of human visual color perception be easily applied to text rendering on displays? How linear is human visual contrast perception at band limit of spatial resolution? How much does visual acuity vary at 20/20 vision? How to best consider preferred viewing distance for readability of text? How colorful does the rendered text appear on the screen? How much of color contrast will remain? How much does viewing angle influence the performance of subpixel layouts and color subpixel rendering?

2.2 “Why simulations of colour for CVD observers might not be what they seem” Phil Green, Gjøvik University College (Norway)

A common task in universal design is to create a 'simulation' of the appearance of a colour image as it appears to a CVD observer. Although such simulations are useful in illustrating the particular problems that a CVD observer has in discriminating between colours in an image, it may not be reasonable to assume that such a simulation accurately conveys the experience of the CVD observer to an observer with normal vision.

Two problems with this assumption are discussed here. First, it risks confusing appearance with sensation. A colour appearance model can more or less accurately predict the change in appearance of a colour when it is viewed under different conditions, but does not define the actual sensation - the 'qualia'. As Wittgenstein and others have pointed out, such a sensation is ineffable and cannot be directly communicated but merely located on a scale with other related sensations. In Wittgenstein's example, the hypothesis that the sensation experienced by observer 1 when viewing a red object is the same sensation as that experienced by observer 2 when viewing a green object cannot be disproved. In practice we avoid this epistemological problem by asking observers to judge colour matches, relations and differences, none of which requires examination of the sensation itself. Since we do not truly know what sensation a normal observer experiences, it seems unscientific to suppose that we can do so for CVD observers.

Secondly, and following from the above, the relation between stimulus and corresponding sensation is established as part of neural development during infancy, and while we can determine the stimulus we cannot readily determine what sensation the stimulus is mapped to, or what the available range of sensations is for a given observer. A plausible hypothesis that the same range of sensations are available to CVD observers as to normal observers, but that the CVD observer has difficulty in differentiating between certain stimuli and thus consistently experiencing the same sensations as the normal observer. This does not preclude the possibility that the 'red' and 'green' sensations experienced by the normal observer are available to the CVD observer under the right conditions, and if this were the case it might suggest potential avenues for future research.

3. THE PREVIOUS DARK SIDE SESSIONS

Here is a list of the speakers and topics that have participated at the previous Dark Side of Color sessions.

3.1 The dark side of color I (2009)

“Well asked questions” Reiner Eschbach

“Pictorial information as transcribed by the artist or designer” Stephen Hoskins

“Consider the Size: And Other Display Features” Garrett M. Johnson

“Adaptation! ... What Adaptation?” John McCann
“The Opposite of Green is Purple?” Nathan Moroney
“Now...what color was that again?” Sabine Süssstrunk
“Stepford – the city for Colour Engineering” Stephen Westland

3.2 The dark side of color II (2010)

“Color naming: color scientists do it between Munsell Sheets of Color” Giordano Beretta and Nathan Moroney
“Size matters: The problem of color-difference estimation for small visual targets” Robert C. Carter and Louis D. Silverstein
“Controlled versus uncontrolled viewing conditions in color evaluation” Reiner Eschbach
“Mind over Matter” Jennifer Gille
“Globalization of color” Paul Hubel
“The appearance of illusions and the delusion of reality” John McCann

3.3 The dark side of color III (2011)

“The Color Side of Dark” Raja Bala
“What a bad signal from this strange device!” Alessandro Rizzi
“HDR Imaging and Color Constancy: Two Sides of the Same Coin?” John McCann
“Is the future of digital printing paperless?” Giordano Beretta, Eric Hoarau, Jun Zeng
“Can less be more?” Jan Allebach
“Can displays go wild?” Gabriel Marcu

3.4 The dark side of color IV (2012)

“The dark side of CIELAB” Gaurav Sharma and Carlos Eduardo Rodriguez-Pardo
“Complexities of complex contrast” Eliezer Peli
“It's not the pixel count, you fool” Michael A. Kriss
“Color imaging and aesthetics: is there the cheshire cat?” Elena A. Fedorovskaya
“Dark texture in artworks” Carinna E. Parraman
“Harmonious colors: from alchemy to science” Giordano B. Beretta, Nathan M. Moroney

3.5 The dark side of color V (2013)

“Can trichromats really know what dichromats see?” Michael H. Brill, Datacolor (United States)
“Color scales for visualization: traveling through color space” Bernice E. Rogowitz, Visual Perspectives Consulting (United States)
“Color spaces” Jan J. Koenderink, Technische Univ. Delft (Netherlands)
“You can't rely on color, yet we all do” Floris L. van Nes, Technische Univ. Eindhoven (Netherlands)
“How 'high-level' is human color perception? Michael E. Rudd, Univ. of Washington (United States)
“Complex spatiochromatic interactions in a real world art laboratory” Scott Daly, Dolby Labs., Inc. (United States)

3.6 The dark side of color VI (2014)

“ColorChecker at the beach: dangers of sunburn and glare” John J. McCann, McCann Imaging (United States)
“The bright future of metameric blacks” Philipp Urban, Fraunhofer-Institut für Graphische Datenverarbeitung (Germany)
“Feeling edgy about color blindness” Reiner Eschbach, Stephen Morgana, Xerox Corp. (United States); Anna Quaranta, Cristian Bonanomi, Alessandro Rizzi, Università degli Studi di Milano (Italy)
