Volume 9482

Proceedings of SPIE 0277-786X, V. 9482

SPIE is an international society advancing an interdisciplinary approach to the science and application of light.

Next-Generation Spectroscopic Technologies VIII, edited by Mark A. Druy,
Richard A. Crocombe, David P. Bannon, Proc. of SPIE Vol. 9482, 948201
© 2015 SPIE · CCC code: 0277-786X/15/\$18 · doi: 10.1117/12.2197711

Proc. of SPIE Vol. 9482 948201-1

The papers included in this volume were part of the technical conference cited on the cover and title page. Papers were selected and subject to review by the editors and conference program committee. Some conference presentations may not be available for publication. The papers published in these proceedings reflect the work and thoughts of the authors and are published herein as submitted. The publisher is not responsible for the validity of the information or for any outcomes resulting from reliance thereon.

Please use the following format to cite material from this book:

Paper Numbering: Proceedings of SPIE follow an e-First publication model, with papers published first online and then in print. Papers are published as they are submitted and meet publication criteria. A unique citation identifier (CID) number is assigned to each article at the time of the first publication. Utilization of CIDs allows articles to be fully citable as soon as they are published online, and connects the same identifier to all online, print, and electronic versions of the publication. SPIE uses a six-digit CID article numbering system in which:

- The first four digits correspond to the SPIE volume number.
- The last two digits indicate publication order within the volume using a Base 36 numbering system employing both numerals and letters. These two-number sets start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B ... 0Z, followed by 10-1Z, 20-2Z, etc.

The CID Number appears on each page of the manuscript. The complete citation is used on the first page, and an abbreviated version on subsequent pages.

Contents

vii	<i>Authors</i>
ix	<i>Conference Committee</i>
xi	<i>Introduction</i>

SESSION 1 MINIATURE, PORTABLE AND HANDHELD INSTRUMENTS

9482 03	Chromium speciation using large scale plasmas in a lab and towards field deployable speciation by employing a battery-operated microplasma-on-a-chip and optical emission spectrometry [9482-3]
9482 04	Review and recent progress of handheld spectrometry at Thermo Fisher Scientific (Invited Paper) [9482-4]
9482 06	A full featured handheld LIBS analyzer with early results for defense and security [9482-6]

SESSION 2 NEW INSTRUMENTS AND TECHNIQUES

9482 0A	Characterization of ion-assisted induced absorption in A-Si thin films used for multivariate optical computing [9482-11]
9482 0B	Photoacoustic sensing with micro tuning forks (Invited Paper) [9482-12]
9482 0C	Latest developments in Texas Instruments DLP near-infrared spectrometers enable the next generation of embedded compact, portable systems [9482-13]
9482 0D	Quantitative energy dispersive x-ray diffraction for identification of counterfeit medicines: a preliminary study [9482-14]
9482 0E	Infrared spectroscopy for chemical agent detection using tailored hypersorbent materials [9482-15]
9482 0F	Developing mobile LIBS solutions for real world applications [9482-16]
9482 0G	Spectral analysis of rare earth elements using laser induced breakdown spectroscopy [9482-17]

SESSION 3 SMARTPHONE SPECTROSCOPY

9482 0H	Is "good enough" good enough for portable visible and near-visible spectrometry? (Invited Paper) [9482-19]
9482 0J	Smartphone spectroscopy: three unique modalities for point-of-care testing (Invited Paper) [9482-21]

- 9482 OL **Integrated smartphone imaging of quantum dot photoluminescence and Förster resonance energy transfer (Invited Paper)** [9482-23]
- 9482 OM **Mobile phone based mini-spectrometer for rapid screening of skin cancer** [9482-24]
- 9482 ON **Portable computing for taking part of the lab to the sample types of applications: from hand held personal digital assistants to smart phones for mobile spectrometry** [9482-25]
- 9482 OP **Gas detection with microelectromechanical Fabry-Perot interferometer technology in cell phone** [9482-27]

SESSION 4 NOVEL INFRARED AND RAMAN INSTRUMENTS AND APPLICATIONS

- 9482 OR **Determination of stress in silicon wafers using Raman spectroscopy** [9482-29]
- 9482 OS **Fuel flexibility via real time Raman fuel gas analysis for turbine system control** [9482-30]
- 9482 OT **Modular reconfigurable matched spectral filter spectrometer** [9482-32]

SESSION 5 HYPERSPECTRAL IMAGING I

- 9482 OU **High spatial resolution LWIR hyperspectral sensor** [9482-33]
- 9482 OV **Dewar cooler integrated MWIR spectrometer for high rates and high dynamic range measurements** [9482-34]
- 9482 OW **Compact, high performance hyperspectral systems design and applications** [9482-35]
- 9482 OX **Portable, stand-off spectral imaging camera for detection of effluents and residues** [9482-36]
- 9482 OY **Detection and direct identification of liquid contaminants at standoff distances with an imaging polarimetric spectrometer** [9482-37]
- 9482 OZ **Longwave infrared compressive hyperspectral imager** [9482-38]
- 9482 IO **Hyperspectral grating optimization and manufacturing considerations** [9482-39]

SESSION 6 CHEMOMETRICS & HYPERSPECTRAL IMAGING

- 9482 II **Fluorescent marker-based and marker-free discrimination between healthy and cancerous human tissues using hyper-spectral imaging** [9482-40]
- 9482 IJ **Spectral data analysis approaches for improved provenance classification** [9482-42]
- 9482 IK **Filter selection criteria for the discrimination of strongly overlapping chemical spectra** [9482-43]

SESSION 7	HYPERSPECTRAL IMAGING II
9482 14	Compact hyperspectral image sensor based on a novel hyperspectral encoder [9482-44]
9482 15	Low SWaP multispectral sensors using dichroic filter arrays [9482-47]
9482 16	Performance characterization of VNIR & SWIR spectropolarimetric imagers [9482-46]
SESSION 8	HYPERSPECTRAL IMAGING III
9482 17	Inverse analysis of triarylamine dye transmission spectra [9482-48]
9482 18	Weighted Chebyshev distance classification method for hyperspectral imaging [9482-49]
9482 1B	Simulation of wake vortex radiometric detection via jet exhaust proxy [9482-53]
SESSION 9	HYPERSPECTRAL IMAGING IV
9482 1D	Data products of NASA Goddard's LiDAR, hyperspectral, and thermal airborne imager (G-LiHT) [9482-45]
9482 1E	Miniaturization of high spectral spatial resolution hyperspectral imagers on unmanned aerial systems [9482-58]
9482 1F	Shadow removal from VNIR hyperspectral remote sensing imagery with endmember signature analysis [9482-55]
9482 1H	Performance results of pixel co-registered VisNIR-SWIR hyperspectral imaging system [9482-59]
	POSTER SESSION
9482 1J	Micro-Raman spectroscopy for meat type detection [9482-10]

Authors

Numbers in the index correspond to the last two digits of the six-digit citation identifier (CID) article numbering system used in Proceedings of SPIE. The first four digits reflect the volume number. Base 36 numbering is employed for the last two digits and indicates the order of articles within the volume. Numbers start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B...0Z, followed by 10-1Z, 20-2Z, etc.

Conference Committee

Symposium Chair

Wolfgang Schade, Clausthal University of Technology and Fraunhofer
Heinrich-Hertz Institute (Germany)

Symposium Co-chair

Ming C. Wu, University of California, Berkeley (United States)

Conference Chairs

Mark A. Druy (United States)
Richard A. Crocombe, PerkinElmer, Inc. (United States)
David P. Bannon, Headwall Photonics Inc. (United States)

Conference Program Committee

Leigh J. Bromley, Daylight Solutions (United States)
John M. Dell, The University of Western Australia (Australia)
Richard D. Driver, Headwall Photonics, Inc. (United States)
Jason M. Eichenholz, Open Photonics, Inc. (United States)
Michael B. Frish, Physical Sciences, Inc. (United States)
Fredrick G. Haibach, BaySpec, Inc. (United States)
Willem Hoving, Anteryon BV (Netherlands)
Vassili Karanassios, University of Waterloo (Canada)
Martin Kraft, Carinthian Tech Research AG (Austria)
Jouko O. Malinen, VTT Technical Research Center of Finland (Finland)
Curtis A. Marcott, Light Light Solutions, LLC (United States)
Ellen V. Miseo, Hamamatsu Corporation (United States)
Jeffry J. Santman, Corning Advanced Optics (United States)
David W. Schiering, Smiths Detection (United States)
John Seelenbinder, Agilent Technologies (United States)
Ulrike Willer, Technische Universität Clausthal (Germany)

Session Chairs

- 1 Miniature, Portable and Handheld Instruments
Mark A. Druy (United States)
- 2 New Instruments and Techniques
Jeffry J. Santman, Corning Advanced Optics (United States)

- 3 Smartphone Spectroscopy
Richard A. Crocombe, PerkinElmer, Inc. (United States)
- 4 Novel Infrared and Raman Instruments and Applications
Leigh J. Bromley, Daylight Solutions, Inc. (United States)
- 5 Hyperspectral Imaging I
Ulrike Willer, Technische Universität Clausthal (Germany)
- 6 Chemometrics & Hyperspectral Imaging
Ellen V. Miseo, Hamamatsu Corporation (United States)
- 7 Hyperspectral Imaging II
Ellen V. Miseo, Hamamatsu Corporation (United States)
- 8 Hyperspectral Imaging III
David P. Bannon, Headwall Photonics, Inc. (United States)
- 9 Hyperspectral Imaging IV
David P. Bannon, Headwall Photonics, Inc. (United States)

Introduction

The past twenty-five years have seen a massive investment in photonics, electronics, and MEMS, aimed at developing new telecommunications capabilities and innovative consumer products. This has led to advances in miniature optics, light sources, tunable filters, array detectors, fiber optic sensors, and a range of other photonic devices, across the whole electromagnetic spectrum, along with technologies for their mass production. Similarly, in recent years, there have been remarkable developments in handheld consumer electronics, especially cell phones ("smartphones"). Today's devices contain advances in RF technology, processors, displays, operating systems, user interfaces, memory, Bluetooth, WiFi, GPS, cameras, accelerometers, etc. These technologies are increasingly being exploited in new spectroscopic instruments, and are now poised to be the basis of next-generation handheld scientific instruments.

Advances in array detectors (CCD, CID, InGaAs, InSb, MCT, CMOS, etc.) are enabling a new generation of faster imaging spectrometers, with both laboratory and field applications. Lower-cost infrared arrays have been developed, employing MEMS techniques. New laser sources, particularly in the mid-infrared, are being used in combination with advances in detector technology to create new spectroscopic platforms. The concurrent improvements in analytical theory, data analysis methods, algorithms and the power of portable processors enable instrument designers to 'put a PhD scientist in the box', and empower field spectroscopic devices to give specific actionable answers.

Portable and handheld instruments tend to be more targeted at specific applications than their laboratory predecessors. They may have performance (measured as resolution, spectroscopic range, signal-to-noise, etc.) that is 'good enough' for field screening applications. However, they are often more selective, smaller, cheaper, more robust, and designed to give these actionable answers to non-scientist operators in the field. Spectroscopy-based systems are now making critical judgments in environments and applications that were unreachable twenty years ago, from hazardous materials to the operating theater, and from field geologists to customs and border personnel.

The emphasis in this conference is on advanced technologies for spectroscopic instrumentation, particularly the uv-visible, infrared, near-infrared, and Raman molecular techniques, but also including advances enabling miniature and portable spectrometers across the electromagnetic spectrum, including x-ray fluorescence, laser induced fluorescence, laser induced breakdown spectroscopy (LIBS), Terahertz, nuclear magnetic resonance and mass

spectrometry. The conference also includes papers describing breakthrough and novel, recently-introduced, commercial instrumentation, and demonstrations using cell phones for diagnostic purposes and the collection of analytical data for distributed point sensing.

This conference premiered at Optics East 2007 in Boston, MA and is now part of the Sensing Technology and Applications Symposium. For 2015, an existing SPIE conference (Spectral Imaging Sensor Technologies: Innovation Driving Advanced Application Capabilities) was merged into Next-Generation Spectroscopic Technologies. With that merger, the 2015 Conference spanned three days, and was divided into sessions focusing on: Miniature, Portable and Handheld Instruments; New Instruments and Techniques; Smartphone Spectroscopy; Novel Infrared and Raman Applications; Hyperspectral Imaging; Chemometrics and Hyperspectral Imaging. The Conference Chairs believe that this is the first SPIE session devoted to "Smartphone Spectroscopy" and anticipate that this will be a continuing and growing part of this Conference. In all, 48 papers were presented, and we present 40 in this volume.
