Event: SPIE Optical Engineering + Applications, 2015, San Diego, California, United States

PROCEEDINGS OF SPIE

Optics for EUV, X-Ray, and Gamma-Ray Astronomy VII

**Stephen L. O'Dell
Giovanni Pareschi**
Editors

**10–13 August 2015
San Diego, California, United States**

Sponsored and Published by
SPIE

Volume 9603

Proceedings of SPIE 0277-786X, V. 9603

SPIE is an international society advancing an interdisciplinary approach to the science and application of light.

Optics for EUV, X-Ray, and Gamma-Ray Astronomy VII, edited by Stephen L. O'Dell, Giovanni Pareschi,
Proc. of SPIE Vol. 9603, 960301 · © 2015 SPIE · CCC code: 0277-786X/15/\$18 · doi: 10.1117/12.2218580

Proc. of SPIE Vol. 9603 960301-1

The papers in this volume were part of the technical conference cited on the cover and title page. Papers were selected and subject to review by the editors and conference program committee. Some conference presentations may not be available for publication. Additional papers and presentation recordings may be available online in the SPIE Digital Library at SPIEDigitalLibrary.org.

The papers reflect the work and thoughts of the authors and are published herein as submitted. The publisher is not responsible for the validity of the information or for any outcomes resulting from reliance thereon.

Please use the following format to cite material from these proceedings:

Author(s), "Title of Paper," in *Optics for EUV, X-Ray, and Gamma-Ray Astronomy VII*, edited by Stephen L. O'Dell, Giovanni Pareschi, Proceedings of SPIE Vol. 9603 (SPIE, Bellingham, WA, 2015) Six-digit Article CID Number.

Printed in the United States of America.

Publication of record for individual papers is online in the SPIE Digital Library.

**SPIE. DIGITAL
LIBRARY**
SPIEDigitalLibrary.org

Paper Numbering: *Proceedings of SPIE* follow an e-First publication model. A unique citation identifier (CID) number is assigned to each article at the time of publication. Utilization of CIDs allows articles to be fully citable as soon as they are published online, and connects the same identifier to all online and print versions of the publication. SPIE uses a six-digit CID article numbering system structured as follows:

- The first four digits correspond to the SPIE volume number.
- The last two digits indicate publication order within the volume using a Base 36 numbering system employing both numerals and letters. These two-number sets start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B ... 0Z, followed by 10-1Z, 20-2Z, etc. The CID Number appears on each page of the manuscript.

Contents

vii	<i>Authors</i>
xi	<i>Conference Committee</i>
xv	<i>Introduction</i>

SESSION 1 CHERENKOV TELESCOPES

9603 02	An overview on mirrors for Cherenkov telescopes manufactured by glass cold-shaping technology [9603-1]
9603 03	The ASTRI SST-2M prototype for the Cherenkov Telescope Array: opto-mechanical test results [9603-2]
9603 04	The ASTRI SST-2M prototype for the Cherenkov Telescope Array: primary mirror characterization by deflectometry [9603-3]
9603 05	Toward the construction of a medium size prototype Schwarzschild-Couder telescope for CTA [9603-4]
9603 06	Results and developments from the 12m Davies-Cotton medium-sized telescope prototype for the Cherenkov Telescope Array [9603-5]
9603 07	Roughness tolerances for Cherenkov telescope mirrors [9603-6]

SESSION 2 LAUE LENSES

9603 08	Hard x-ray broad band Laue lenses (80-600 keV): building methods and performances [9603-7]
9603 09	Rapid and accurate assembly method for a new Laue lens prototype [9603-8]

SESSION 3 X-RAY TELESCOPES

9603 0C	Status of ART-XC / SRG instrument [9603-11]
9603 0D	Ultra high throughput four-reflection x-ray telescope for high resolution spectroscopy [9603-12]
9603 0F	Development of an x-ray telescope with a large effective area for the iron K line band [9603-64]

SESSION 4	DESIGN AND ANALYSES
9603 OG	New ray-tracing capabilities for the development of Silicon Pore Optics [9603-14]
9603 OH	Analytical computation of stray light in nested mirror modules for x-ray telescopes [9603-15]
9603 OI	On the statistical error of the half energy width [9603-16]
SESSION 5	SILICON-PORE OPTICS
9603 OJ	The Athena optics [9603-17]
9603 OK	Silicon pore optics development for ATHENA [9603-18]
9603 OL	Silicon pore optics mirror modules for inner and outer radii [9603-19]
9603 OM	Investigation of photolithography process on SPOs for the Athena mission [9603-20]
SESSION 6	SLUMPED-GLASS OPTICS
9603 ON	A design study of mirror modules and an assembly based on the slumped glass for an Athena-like optics [9603-21]
9603 OO	Slumped glass optics for x-ray telescopes: advances in the hot slumping assisted by pressure [9603-22]
9603 OP	Slumped glass optics with interfacing ribs for high angular resolution x-ray astronomy: a progress report [9603-23]
9603 OQ	Toward diffraction-limited lightweight x-ray optics for astronomy [9603-24]
9603 OR	Progress report on air bearing slumping of thin glass mirrors for x-ray telescopes [9603-25]
9603 OS	Indirect glass slumping for future x-ray missions: overview, status and progress [9603-26]
9603 OT	Addressing the problem of glass thickness variation in the indirect slumping technology [9603-60]
SESSION 7	OTHER MIRROR TECHNOLOGIES
9603 OU	Development of precision Wolter mirrors for future solar x-ray observations [9603-27]
9603 OV	Direct fabrication of full-shell x-ray optics [9603-28]
9603 OW	Fabrication of high resolution and lightweight monocrystalline silicon x-ray mirrors [9603-29]

- 9603 0Y **Development of an x-ray telescope using the carbon fiber reinforced plastic (CFRP)**
[9603-65]

SESSION 8 ALIGNMENT AND ASSEMBLY

- 9603 0Z **Aligning, bonding, and testing mirrors for lightweight x-ray telescopes** [9603-31]
- 9603 10 **Cold shaping of thin glass foils: a fast and cost-effective solution for making light-weight astronomical x-ray optics** [9603-32]
- 9603 11 **JIM: a joint integrated module of glass x-ray optics for astronomical telescopes** [9603-33]
- 9603 12 **Liquid metal actuators: correctable mounting and assembly of thin-shell x-ray telescope mirrors** [9603-34]
- 9603 13 **Coarse alignment of thin-shell, segmented mirrors for Wolter-I telescopes** [9603-59]

SESSION 9 DISPERSION GRATINGS

- 9603 14 **High-efficiency blazed transmission gratings for high-resolution soft x-ray spectroscopy**
[9603-35]
- 9603 15 **Optical and x-ray alignment approaches for off-plane reflection gratings** [9603-36]
- 9603 16 **Diffraction efficiency of radially profiled off-plane reflection gratings** [9603-37]
- 9603 17 **Off-plane x-ray reflection grating fabrication** [9603-61]

SESSION 10 POLARIMETRIC OPTICAL ELEMENTS

- 9603 18 **Polarization sensitivity testing of off-plane reflection gratings** [9603-38]
- 9603 19 **The use of laterally graded multilayer mirrors for soft x-ray polarimetry** [9603-39]
- 9603 1A **High efficiency carbon-based multilayers for LAMP at 250 eV** [9603-40]

SESSION 11 MULTILAYER COATINGS

- 9603 1C **Advancements in hard x-ray multilayers for x-ray astronomy** [9603-42]
- 9603 1D **Development of Ni-based multilayers for future focusing soft gamma ray telescopes**
[9603-43]
- 9603 1E **A soft gamma-ray concentrator using thin-film multilayer structures** [9603-44]

SESSION 12	DIFFERENTIAL DEPOSITION
9603 1F	Progress in differential deposition for improving the figures of full-shell astronomical grazing incidence x-ray optics [9603-45]
9603 1G	Differential deposition correction of segmented glass x-ray optics [9603-46]
9603 1H	Two-dimensional differential deposition: figure correction of thin-shell mirror substrates for x-ray astronomy [9603-47]
SESSION 13	COATING STRESS CONTROL
9603 1I	Using iridium films to compensate for piezo-electric materials processing stresses in adjustable x-ray optics [9603-49]
9603 1J	Stress manipulated coating for figure reshape of light weight x-ray telescope mirrors [9603-50]
9603 1K	Ion implantation for figure correction of thin x-ray telescope mirror substrates [9603-51]
SESSION 14	ACTIVE OPTICS
9603 1M	Improved control and characterization of adjustable x-ray optics [9603-53]
9603 1O	Investigation of magnetically smart films applied to correct the surface profile of light weight x-ray optics in two directions [9603-55]
SESSION 15	TESTING AND METROLOGY
9603 1P	BEaTriX, expanded x-ray beam facility for testing modular elements of telescope optics: an update [9603-56]
9603 1Q	A Fresnel zone plate collimator: potential and aberrations [9603-57]
9603 1S	Design and implementation of an x-ray reflectometer system for testing x-ray optics coatings [9603-62]
9603 1T	Development of a deflectometer for accurate surface figure metrology [9603-63]

Authors

Numbers in the index correspond to the last two digits of the six-digit citation identifier (CID) article numbering system used in Proceedings of SPIE. The first four digits reflect the volume number. Base 36 numbering is employed for the last two digits and indicates the order of articles within the volume. Numbers start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B...0Z, followed by 10-1Z, 20-2Z, etc.

Introduction

The conference *Optics for EUV, X-Ray, and Gamma-Ray Astronomy VII* met 10–13 August, in San Diego, California, as part of the **SPIE Optics + Photonics 2015** international symposium **Optical Engineering + Applications**. As with the previous conferences in this series, it provided an effective forum for discussion of recent progress in imaging and spectroscopic optics for EUV, x-ray, and gamma-ray astronomy. More than 60 papers presented in the 15 Conference sessions reported upon advances in optical science and technology relevant to such optics.

Currently operating x-ray observatories—*Chandra*, *XMM-Newton*, *Swift*, *NuSTAR*, and *Hinode*—demonstrate the importance of imaging optics to x-ray astronomy. Launching within the next few years, *Spectrum Röntgen Gamma*'s *eROSITA* will conduct the most sensitive x-ray all-sky survey; *Astro-H* will provide soft- and hard-x-ray focusing telescopes—including a soft-x-ray imaging micro-calorimeter. In this same period, India and China will each launch its first dedicated astronomical satellite—the multi-band *Astrosat* and the Hard X-ray Modulation Telescope (HXMT), respectively. Collectively, these missions significantly advance technologies for high angular resolution, large collecting areas, high spectral resolution, broad spectral coverage, and lightweight optical components.

NASA, ESA, and JAXA continue to develop technologies for lightweight, large-area, high-resolution x-ray mirror and grating systems that will enable future x-ray observatories. Indeed, ESA recently selected *ATHENA*—an x-ray mission enabled by development of innovative x-ray optics—to be launched by 2018 as the second large-class Cosmic-Vision mission. Meanwhile, NASA is starting to study the “X-ray Surveyor”, with a goal to implement a mission having the exquisite angular resolution of *Chandra* but a throughput 10–30 times larger. Together with research into more futuristic topics—including diffractive or interferometric imaging and active optics—significant progress continues worldwide toward meeting the future needs of EUV, x-ray, and gamma-ray astronomy.

Session 1 treated normal-incidence mirrors for Imaging Atmospheric **Cherenkov Telescopes** (IACTs). This approach employs arrays of ground-based telescopes with moderate angular resolution and large collecting areas, to detect visible Cherenkov light produced by atmospheric charged-particle showers initiated by γ -ray photons in the 20 GeV to 100 TeV band. Currently, three main IACT systems—HESS, MAGIC, and VERITAS—are operating; the Cherenkov Telescope Array Observatory (CTAO) is under development. Papers discussed recent progress in a mirror manufacturing technique based upon cold-shaping glass, as well as development of prototype telescopes of different sizes for the CTAO.

Session 2 dealt with the development of **Laue Lenses** to focus γ rays with energies from a few tens keV to 1 MeV. These systems, which use Bragg diffraction in transmission, will greatly improve the sensitivity for soft γ -ray astronomy over that provided by the non-focusing detectors used thus far. Having demonstrated the basic technology in balloon experiments, current efforts to consolidate the technology aim for implementation in a satellite mission. In particular, very interesting reports described integration methods to align and to assemble many crystal tiles into a large Laue lens for such a mission.

Session 3 described **X-ray Telescopes** that are in preparation or proposed. The ART-XC hard-x-ray instrument based upon focusing optics, is part of *Spectrum Röntgen Gamma*, which will be launched in 2017. In a more preliminary stage, efforts continue toward development of a high-throughput four-reflection x-ray telescope for a future mission—such as DIOS.

Session 4 discussed computational tools for **Design and Analyses** of x-ray optics. New ray-tracing and analytical approaches for simulating x-ray optical systems are important for optimizing performance and for identifying issues potentially impacting the scientific utility of future observatories.

Session 5 reported progress in **Silicon-pore Optics**. ESA is supporting development of this novel technology for segmented optics with high throughput and good angular resolution, as a baseline for its ATHENA mission. Having obtained promising results thus far, the current goal is to demonstrate definitively the capability to meet ATHENA's performance requirements—about 2-m² effective area (1 keV) and 5-arcsec resolution (HEW) over a 40-arcmin field of view.

Session 6 reported progress in **Slumped-glass Optics**. Presentations described various approaches and aspects of this technology that are being developed in the US and in Europe. The NuSTAR mission demonstrated the capabilities of slumped-glass x-ray optics for medium-resolution (<1-arcmin) imaging. Recent results show that this technology can achieve <10-arcsec resolution (HEW).

Session 7 addressed **Other Mirror Technologies** for fabrication of x-ray optics. Direct fabrication or replication of thin monolithic full-shell mirrors remains attractive due to the simplicity of alignment and assembly relative to those processes for segmented mirrors. However, for very-large-area x-ray telescopes, segmented mirrors have an advantage in scalability and modularity. Recent advances in precision fabrication of thin single-crystal silicon segmented mirrors is particularly exciting.

Session 8 described approaches for **Alignment and Assembly** of future high-angular-resolution x-ray optics. Several papers reported recent accomplishments on these themes, including a “cold” shaping mirrors and integration using reinforcing ribs to impart appropriate curvature to initially flat substrates. This

could be a fast and cost-effective solution for making low-weight and low-cost x-ray optics.

Session 9 discussed **Dispersion Gratings** for high-resolution spectroscopy for soft x-ray astronomy. This field is progressing rapidly in the USA through the development of high-efficiency blazed (critical-angle) transmission gratings and off-plane reflection gratings.

Session 10 reported recent investigations on **Polarimetric Optical Elements** for x-ray astronomy, which utilize multilayer coatings operating at the Brewster angle (45°) for analysis of linear polarization, as foreseen for the Chinese LAMP experiment. In a novel variation of this approach, laterally graded multilayers in combination with dispersion gratings provide spectral polarimetry over a broad range of soft-x-ray energies.

Sessions 11, 12, and 13 covered various topics in coatings for x-ray optics—**Multilayer Coatings**, **Differential Deposition**, and **Coating Stress Control**, respectively. The research in **Multilayer Coatings** seeks to enable focused imaging of cosmic sources at hard-x-ray and soft-gamma-ray energies—up to a few hundred keV, as an alternative to Laue lenses. Efforts in **Differential Deposition** aim to use this additive-machining process as a low-force method for post-fabrication figure correction of thin mirrors at mid-to-high spatial frequencies. **Coating Stress Control** is particularly important for the thin x-ray mirrors needed for large-area focusing x-ray telescopes. Its objective is either to minimize the stress so as to avoid distorting a thin mirror, or to manipulate the stress in order to correct predictably the figure of the mirror at low-to-mid spatial frequencies. Stress manipulation is achieved either through control of the coating parameters during deposition or through post-deposition stress modification—e.g., through ion implantation.

Session 14 reported progress in development of **Active Optics** for x-ray astronomy. Using the piezoelectric bimorph (or an analogous magnetostrictive) effect, active optics enables adjustment of a mirror's figure after fabrication and mounting, at low-to-mid spatial frequencies. In order to achieve sub-arcsecond imaging using highly nested, lightweight x-ray mirrors, the X-ray Surveyor may require a combination of static and active post-fabrication figure correction.

Finally, **Session 15** addressed **Testing and Metrology**. Papers on Testing described two new methods to produce a parallel, monochromatic x-ray beam of large size, using optical elements that collimate x rays generated by conventional sources. Such an approach would facilitate testing and calibration of large-diameter focusing x-ray telescopes—e.g., ATHENA. Papers on Metrology reported development of specific instruments for reflectometry and for deflectometry of x-ray mirrors.

We thank the Conference Committee for helping to organize the technical program and for fostering broad participation, and the session chairs and

presenters for a successful and stimulating conference. We also appreciate the efforts of the SPIE staff in organizing the Conference and in publishing the Proceedings.
