Volume 9855

Proceedings of SPIE 0277-786X, V. 9855

SPIE is an international society advancing an interdisciplinary approach to the science and application of light.

Next-Generation Spectroscopic Technologies IX, edited by Mark A. Druy, Richard A. Crocombe,
Proc. of SPIE Vol. 9855, 985501 · © 2016 SPIE · CCC code: 0277-786X/16/\$18 · doi: 10.1117/12.2231209

Proc. of SPIE Vol. 9855 985501-1

The papers in this volume were part of the technical conference cited on the cover and title page. Papers were selected and subject to review by the editors and conference program committee. Some conference presentations may not be available for publication. Additional papers and presentation recordings may be available online in the SPIE Digital Library at SPIEDigitalLibrary.org.

The papers reflect the work and thoughts of the authors and are published herein as submitted. The publisher is not responsible for the validity of the information or for any outcomes resulting from reliance thereon.

Please use the following format to cite material from these proceedings:

Author(s), "Title of Paper," in *Next-Generation Spectroscopic Technologies IX*, edited by Mark A. Druy, Richard A. Crocombe, Proceedings of SPIE Vol. 9855 (SPIE, Bellingham, WA, 2016) Six-digit Article CID Number.

Copying of material in this book for internal or personal use, or for the internal or personal use of specific clients, beyond the fair use provisions granted by the U.S. Copyright Law is authorized by SPIE subject to payment of copying fees. The Transactional Reporting Service base fee for this volume is \$18.00 per article (or portion thereof), which should be paid directly to the Copyright Clearance Center (CCC), 222 Rosewood Drive, Danvers, MA 01923. Payment may also be made electronically through CCC Online at copyright.com. Other copying for republication, resale, advertising or promotion, or any form of systematic or multiple reproduction of any material in this book is prohibited except with permission in writing from the publisher. The CCC fee code is 0277-786X/16/\$18.00.

Printed in the United States of America.

Publication of record for individual papers is online in the SPIE Digital Library.

**SPIE. DIGITAL
LIBRARY**
SPIEDigitalLibrary.org

Paper Numbering: *Proceedings of SPIE* follow an e-First publication model. A unique citation identifier (CID) number is assigned to each article at the time of publication. Utilization of CIDs allows articles to be fully citable as soon as they are published online, and connects the same identifier to all online and print versions of the publication. SPIE uses a six-digit CID article numbering system structured as follows:

- The first four digits correspond to the SPIE volume number.
- The last two digits indicate publication order within the volume using a Base 36 numbering system employing both numerals and letters. These two-number sets start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B ... 0Z, followed by 10-1Z, 20-2Z, etc. The CID Number appears on each page of the manuscript.

Contents

v	<i>Authors</i>
vii	<i>Conference Committee</i>
ix	<i>Introduction</i>

SESSION 1 SMARTPHONE SPECTROSCOPY

9855 02	Miniaturized NIR scanning grating spectrometer for use in mobile phones (Invited Paper) [9855-1]
9855 03	How can wireless, mobile data acquisition be used for taking part of the lab to the sample, and how can it join the internet of things? [9855-2]
9855 04	Built-in hyperspectral camera for smartphone in visible, near-infrared and middle-infrared lights region (first report): trial products of beans-size Fourier-spectroscopic line-imager and feasibility experimental results of middle-infrared spectroscopic imaging [9855-3]
9855 05	Built-in hyperspectral camera for smartphone in visible, near-infrared and middle-infrared lights region (second report): sensitivity improvement of Fourier-spectroscopic imaging to detect diffuse reflection lights from internal human tissues for healthcare sensors [9855-4]
9855 06	Built-in hyperspectral camera for smartphone in visible, near-infrared and middle-infrared lights region (third report): spectroscopic imaging for broad-area and real-time componential analysis system against local unexpected terrorism and disasters [9855-5]
9855 07	MEMS FPI-based smartphone hyperspectral imager [9855-6]

SESSION 2 NOVEL SPECTROMETERS AND APPLICATIONS I

9855 09	Parametric models of reflectance spectra for dyed fabrics [9855-8]
9855 0A	Application of parabolic reflector on Raman analysis of gas samples [9855-9]
9855 0B	3D printing in chemistry: past, present and future [9855-10]

SESSION 3 TUNABLE LASER SPECTROSCOPY

9855 0C	Distributed-feedback interband cascade lasers with reduced contact duty cycles (Invited Paper) [9855-11]
9855 0F	Validation and calibration of a TDLAS oxygen sensor for in-line measurement on flow-packed products [9855-14]

9855 OG **Single-mode interband cascade laser sources for mid-infrared spectroscopic applications**
[9855-15]

9855 OH **Portable low power cavity ring-down spectrometer for precise measurement of carbon dioxide, methane and water vapor** [9855-16]

SESSION 4 NOVEL SPECTROMETERS AND APPLICATIONS II

9855 OL **Long wave infrared tunable filter based on guided mode resonant effect** [9855-20]

9855 OM **Handheld and mobile hyperspectral imaging sensors for wide-area standoff detection of explosives and chemical warfare agents** [9855-21]

9855 ON **A novel CMOS-compatible, monolithically integrated line-scan hyperspectral imager covering the VIS-NIR range** [9855-22]

POSTER SESSION

9855 OP **Optical unmixing using programmable spectral source based on DMD** [9855-24]

9855 OQ **Design of thin-film filters for resolution improvements in filter-array based spectrometers using DSP** [9855-25]

Authors

Numbers in the index correspond to the last two digits of the six-digit citation identifier (CID) article numbering system used in Proceedings of SPIE. The first four digits reflect the volume number. Base 36 numbering is employed for the last two digits and indicates the order of articles within the volume. Numbers start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B...0Z, followed by 10-1Z, 20-2Z, etc.

- 4 Novel Spectrometers and Applications II
Ellen V. Miseo, Hamamatsu Corporation (United States)

Introduction

The past twenty-five years have seen a massive investment in photonics, electronics, and MEMS aimed at developing new telecommunications capabilities and innovative consumer products. This has led to advances in miniature optics, light sources, tunable filters, array detectors, fiber optic sensors, and a range of other photonic devices across the whole electromagnetic spectrum, along with technologies for their mass production. Similarly, in recent years, there have been remarkable developments in handheld consumer electronics, especially mobile devices ("smartphones"). Today's devices contain advances in RF technology, processors, displays, operating systems, user interfaces, memory, Bluetooth, WiFi, GPS, cameras, accelerometers, etc. These technologies are increasingly being exploited in new spectroscopic instruments and are now poised to be the basis of next-generation handheld scientific instruments.

Advances in array detectors (CCD, CID, InGaAs, InSb, MCT, CMOS, etc.) are enabling a new generation of faster imaging spectrometers with both laboratory and field applications. Lower-cost infrared arrays have been developed, employing MEMS techniques. New laser sources, particularly in the mid-infrared, are being used in combination with advances in detector technology to create new spectroscopic platforms. The concurrent improvements in analytical theory, data analysis methods, algorithms, and the power of portable processors enable instrument designers to 'put a PhD scientist in the box' and empower field spectroscopic devices to give specific actionable answers.

Portable and handheld instruments tend to be more targeted at specific applications than their laboratory predecessors. They may have performance (measured as resolution, spectroscopic range, signal-to-noise, etc.) that is 'good enough' for field screening applications. However, they are often more selective, smaller, cheaper, more robust, and designed to give these actionable answers to non-scientist operators in the field. Spectroscopy-based systems are now making critical judgments in environments and applications that were unreachable twenty years ago, from hazardous materials to the operating theater, and from field geologists to customs and border personnel.

This conference focused on advanced technologies for spectroscopic instrumentation, particularly the uv-visible, infrared, near-infrared, and Raman

molecular techniques, but also included advances enabling miniature and portable spectrometers across the electromagnetic spectrum, including x-ray fluorescence, laser induced fluorescence, laser induced breakdown spectroscopy (LIBS), Terahertz, nuclear magnetic resonance, and mass spectrometry.

The conference also included papers describing breakthrough and novel projects, recently-introduced content, commercial instrumentation, and demonstrations using mobile devices for diagnostic purposes and the collection of analytical data for distributed point sensing.

This conference premiered at Optics East 2007 in Boston, MA (United States) and it is now part of the Sensing Technology and Applications Symposium. The 2016 Conference spanned two days and was divided into sessions focusing on: Smartphone Spectroscopy, Novel Spectrometers and Applications, and Tunable Laser Spectroscopy.

The Conference Chairs believe that this Conference in 2015 had the first SPIE session devoted to "Smartphone Spectroscopy", and we anticipate that this will be a continuing and growing part of this Conference. In all, 25 papers were presented, and 18 of which are included in this volume.
