Today, brilliant images are possible with the smallest smartphone lenses. Why then is it still necessary to have large lenses in photography?

**SIZE COMPARISON**

(original sizes)

**SMARTPHONE LEN**

**SLR LEN**
Today, brilliant images are possible with the smallest smartphone lenses. Why then is it still necessary to have large lenses in photography?

Despite their small size, smartphone lenses have sophisticated optics with complex lens arrangements.

The most important consequence of the size difference is the different depths of field.

Smartphones display all objects from near to far with the same sharpness. The depth of field can be set selectively with large SLR lenses.
GESTURE CONTROL

Optical systems can capture and interpret hand movements contactlessly – this is ideal in sterile workplaces such as hospital operating rooms.

SURGICAL HAND-TRACKING SYSTEM
detailed view from below

Two infrared (IR) cameras capture the scene like two human eyes from slightly shifted perspectives. A 3D camera, which is based on the propagation time of light, verifies the distance.
In contrast to early cathode ray tubes, flat screens save a great deal of energy per unit area. Impressive global production capacities meet the high demand for these displays.

**ELECTRICITY CONSUMPTION AT SAME DISPLAY SIZE**

100% - cathode ray tube

25% - LCD

**PRODUCTION OF FLAT SCREENS WITHIN ONE HOUR**

200,000 smartphone displays

2 football fields

Total area of produced flat screens (TVs, tablets, smartphones, and others)
LCD vs OLED

Today, LCD displays dominate the flatscreen market, but in smartphones, organic LEDs (OLEDs) are conquering an increasingly larger market share. OLED displays are thinner, more energy-efficient, and higher in contrast but more expensive to produce.

LCD DISPLAY STRUCTURE

Today’s most common type of display creates images by blocking off or letting through white light that LEDs create across the back of the display.

**LCD – Liquid Crystal Display**

- cover glass
- liquid crystal
- TFT = thin-film transistors
- background lighting (light conductor)
- color filter
- glass filter with polarizing film
- LED strips

**OLED DISPLAY STRUCTURE**

Organically luminous materials in OLED displays do not require a separate light source, which makes their construction depth much thinner.

---

**DISPLAY RESOLUTIONS**

- **Standard resolution**: 720 x 480
- **Full HD**: 1920 x 1080
- **4K Ultra HD**: 3840 x 2160
- **8K Ultra HD**: 7680 x 4320

---

**OLED – Organic Light Emitting Diode**

- **Cover glass**
- **Cathode**
- **Anode**
- **TFT = thin-film transistors**
- **Carrier material (glass or plastic)**
- **Organic layers**
  
  Molecules are electrically excited to make them glow.
