

Index

3D image, 411

3D telepresence, 474

A

aberration and distortion

 compensation, 331

accommodation, 1

accumulate-differences method, 107

acousto-optic modulator (AOM),
 459, 200

active retarder (AR), 420

adjustable image resolution, 331

anaglyph eyeglasses, 417

analog holographic interferometry
(AHI), 52

 double-exposure, 53

 real-time, 53

analog holography (AH), 51

angular plane wave spectrum, 48

angular sampling, 242

artifact-free binary
 modulation, 331

autocorrelation halo, 303

autostereoscopic imaging, 1

azimuthal and ellipticity angles,
 396

B

beamwidth, 27

Berry's phase, 203

binarization algorithm, 329

binocular disparity, 415

branch-cut (BC) method, 63

C

cascading, 330

cathode ray sphere (CRS), 457

cathode ray tubes (CRT), 412

coherence holography (CH), 375

coherent noise, 145

coherent raytrace (CRT) algorithm,
 326

compensated phase-added
 stereogram (CPAS), 473

compressive holography, 337

compressive sensing (CS), 337

computer-assisted tomography
(CAT), 474

computer-generated (CG)
 hologram, 307

confocal microscopy, 474

constitutive relationships, 14

convergence, 1

convolution approach, 141

current density, 14

D

DC suppression, 142

depth cues, 1

depth-fused display (DFD), 445

detour method, 308

diffraction grating, 328

diffraction-specific (DS) algorithm,
 324, 326

diffraction-specific coherent
 panoramagram (DSCP), 416,
 465

diffractive coupling, 76
 diffractive nanodevices (DND), 469
 diffractive optical element (DOE),
 435
 digital holographic interferometry
 with spatial multiplexing
 (DHI-SM), 189
 digital holographic microscopy, 137
 digital holographic tomography
 (DHT), 211
 digital holography, 2, 137
 digital image fusion, 411
 digital light processing (DLP), 412
 displacement current, 14

E

e-beam lithography (EBL), 314
 eikonal equation, 358
 electric field, 14
 electric flux density, 14
 electrically addressed SLM, 468
 electro-optic effect, 11
 electroholographic, 477
 electronic speckle pattern
 interferometry (ESPI), 90
 ellipticity, 391

F

Fabry–Pérot étalons, 292
 field of view (FOV), 5
 field programmable gate arrays
 (FPGAs), 470
 Fizeau interferometer, 380
 fluorescence, 447
 fluorescent dye, 450
 Fourier transform hologram, 51
 Fraunhofer diffraction, 18
 Fresnel diffraction, 17
 Fresnel hologram, 51
 Fresnel number, 20
 Fresnel reconstruction, 147
 Fresnel zone plate (FZP), 318
 Fresnel–Kirchhoff (FK), 49
 fringe deciphering, 83

fringe direction, 90
 fringe direction vector, 91
 fringe orientation, 83
 fringe orientation angle, 92
 fringe orientation vector, 92
 fringe tangential orientation, 93
 full depth cues, 331
 full parallax (FP), 324
 full-view hologram, 5

G

gamma holography, 384
 Gaussian beam propagation, 34
 Gerchberg–Saxton (GS) algorithm,
 315
 gradient-based method, 94
 Gram matrix, 339
 Grating Light Valve™ (GLV™),
 331
 guided-wave scanner (GWS), 464

H

hard thresholding (HTh), 329
 head-mounted display (HMD),
 421
 head tracking, 441
 Helmholtz equation, 47
 hierarchical phase unwrapping, 263
 Hilbert transform, 71
 hogel, 328
 holocamera (HC), 75
 holographic contouring, 260
 holographic coupler extractor,
 422–423
 holographic film, 5
 holographic interferometry, 10, 47
 holographic optical elements
 (HOEs), 422
 holographic reconstruction
 (HORN), 469
 holographic stereogram, 5, 471
 holographic television, 6
 holographic volume-displacement,
 291

- holography, 1
holostereogram, 465
holographic contouring, 257
horizontal parallax, 5
horizontal-parallax-only (HPO)
 hologram, 324
Hurter–Driffield (H&D), 9
- I**
ideal lens, 22
image hologram, 51
image quality, 333
image resolution, 333
image width and field of view, 332
impulse response of propagation,
 49
incoherent holography, 384
integral hologram, 5
integral imaging, 433
- J**
Jacobi–Anger formula, 77
Jones vector, 386
- K**
Kerr nonlinearity, 373
kinoform, 311
- L**
Laplacian operator, 15
laser speckle, 333
laser-induced damage (LID), 448
LED-backlit LCD display, 412
lens transformation, 27
lensless Fourier transform
 holography, 51
lenticular, 431
liquid crystal devices (LCDs), 412
look-up table (LUT), 323
lumped-element model (LEM), 325
- M**
magnetic field, 14
magnetic flux density, 14
magnetic resonance imaging (MRI),
 474
Maxwell’s equations, 14
microelectromechanical systems
 (MEMS), 469
microscopic tomography methods,
 237
microscopy, 1
Michelson stellar interferometry,
 384
moiré topography, 291
motion parallax, 415
multiplex hologram, 5
multiplication and accumulation
 (MAC), 333
multiwavelength digital holographic
 microscopy, 280
mutual intensity, 379
- N**
non-Bragg diffraction, 75
nonlinear holography, 372
nonlinear Schrödinger (NLS),
 373
normal strain, 193
normalized-mean-square error
 (NMRS), 329
numerical flattening, 294
- O**
obliquity factor, 48
occlusion, 415
off-axis setup, 4
offset diverging lens and
 electrically tunable lens
 (OL/ETL), 367
on-axis setup, 4
optical efficiency, 330
optically addressed LCD
 (OALCD), 459
orthoscopic (OR), 478
Oscar Reutersvärd’s optical illusion,
 412
out-of-plane deformation, 54

P

Pancharatnam–Berry phase, 201
 parallel binarization technique, 324
 paraxial approximation, 18
 patterned retarder (PR), 419
 Penrose stairs, 412
 Penrose triangle, 412
 Pepper's ghost illusion, 479
 permeability, 14
 permittivity, 14
 phase, 1
 phase-added stereogram (PAS), 473
 phase-only CG hologram
 see kinoform, 311
 phase-shifting digital holography,
 183, 195
 phase-shifting holographic
 interferometry, 47
 phase unwrapping, 55
 phase-unwrapping max-flow/
 min-cut algorithm (PUMA),
 63
 photographic density, 8
 photographic film, 2, 8
 photographic materials, 7
 photopolymer materials, 13
 photorefractive (PR) materials, 11
 photothermoplastic (PTP) film, 10
 photovoltaic effect, 76
 Phong shading, 326
 physical cues, 412
 piezoelectric transducer (PZT), 199
 ping-pong, 324
 plane-fit method, 94
 point-source hologram, 318
 point spread function (PSF), 49
 polarization imaging, 384
 polymer-dispersed liquid crystal
 (PDLC), 463
 projection onto constrained sets
 (POCS), 329
 pseudoscopic problem, 434
 pseudoscopy (PS), 478
 psychological cues, 412

Q

q-parameter, 26
 Q-switched Nd:YAG laser, 449
 quasi-monochromatic, 379

R

radius of curvature, 27
 rainbow hologram, 6
 Raman–Nath diffraction, 75
 Rayleigh range, 22
 Rayleigh–Sommerfeld (RS), 49
 real image, 2
 referenceless on-axis complex
 hologram (ROACH), 312
 regularization parameter, 346
 regularized phase tracking, 107
 restricted isometry property (RIP),
 339
 root-mean-square error (RMSE),
 316

S

self-diffraction, 74
 sensitivity vector, 195
 shear strain, 193
 shutter in panel (SIP), 420
 simulated annealing direct binary
 search (SADBS), 329
 single-beam holographic
 tomography (SHOT), 211
 single-shot optical tomography
 using the multiplicative
 technique (SHOT-MT), 212
 single-shot optical tomography
 using the Radon transform
 technique (SHOT-RTT),
 212
 skeletonization, 83
 slowly varying envelope
 approximation (SVEA), 359
 space charge, 11
 spatial carrier, 83
 spatial coherence function (SCF),
 380

spatial light modulator (SLM), 307
spin-filter method, 97
split-step method, 374
state of polarization (SOP), 384
stereopsis, 415
stereoscopic imaging, 1
Stokes parameters, 396
stress and strain sensors, 189
super multiview (SMV), 440
surface acoustic wave (SAW), 464
synthetic wavelength, 261

T

tolerance to pixel defects, 330
tomographic compressive
 holography (TCH), 346
topography, 1
total internal reflection (TIR), 422
total variation (TV), 346
transfer function, 17
transport of intensity (TI), 357
tree-matching pursuit (TMP), 340
two-beam coupling, 11
two-illumination-point method, 257
two-refractive-index technique, 257
two-step iterative shrinkage
 thresholding (TwIST), 346

two-wavelength method, 257

V

Van Cittert–Zernike theorem, 375
varifocal, 452
vergence, 411
vergence–accommodation conflict,
 415
vertical parallax, 5
vertical-parallax-only (VPO)
 hologram, 324
virtual image, 2
virtual window (VW), 466
visual accommodation, 411
visual acuity (VA), 426
volumetric imaging, 1
vortex transform, 117
voxel, 416

W

wavefront recording plane method
 (WRPM), 321
Whittaker–Shannon, 159
wide color range, 331

Z

zero padding, 267

Dr. Georges Nehmetallah is currently an Assistant Professor in the EECS department at the Catholic University of America. From 2011–2012, he was at the University of Dayton as a Research Professor; prior to that, he was a Postdoctoral Researcher and Research Engineer with the University of Dayton. He received his Ph.D. in ECE from the University of Dayton in 2006. He has served as a PI and a Co-PI for several SBIR and STTR Phase-I and Phase-II projects for the Air Force, Army, and DARPA, and he was one of the 11 out of over 500 people who received the Army SBIR Achievement Award in 2011. His research interests are in 3D imaging, digital holography, and metamaterials. He has authored a book chapter on soliton stabilization and published more than 70 refereed journal papers, review articles and conference proceedings. Nehmetallah is the recipient of the Newport Spectra-Physics Research Excellence Award (2005), SPIE Educational Scholarship in Optical Science and Engineering (2005), and the 2014 Burns Fellowship Award at CUA. He is a reviewer for *Applied Optics*, *Chinese Optics Letters*, and the *Journal of the Optical Society of America B*. He is a member of OSA and SPIE.

Dr. Rola Aylo is currently a technical advisor at Oblon in the electrical patent prosecution group, where she is involved in the preparation and prosecution of patent applications. Prior to her current position, she worked at the University of Dayton as a Research Associate (2010–2012) in their electro-optics program, then as a lecturer in the EECS department at the Catholic University of America (2013). Aylo has published more than 20 refereed journal papers and conference proceedings in the areas of optical design, metamaterial applications to sensors technology, and nanoparticle dispersed-liquid-crystal cell fabrication and characterization, which was part of a Phase I and Phase II DARPA-sponsored project from 2009–2012. She is the recipient of the SPIE Newport Spectra Research Excellence Award (2009), the Dayton Area Graduate Studies Institute (DAGSI) Scholarship (2008–2009), and the University of Dayton Innovation Incentive Graduate Research Assistantships (2007).

Dr. Logan Williams is a senior research engineer at the United States Air Force School of Aerospace Medicine, Aeromedical Research Division, at Wright-Patterson AFB, Ohio, where he conducts visual perception and visual task performance research. He previously served in the Air Force Research Laboratory, Warfighter Readiness Research Division, where he lead multiple lines of research in various fields, such as human effectiveness, immersive training environments, visual-display system design, and distributed simulation for aircrew training; he has also served as the lead systems engineer for F-16, A-10, and KC-135 aircrew training systems. Williams has almost two decades of experience in analog and digital circuit design, networked control systems, optical and electro-optical system design, computer programming, and physics-based modeling and simulation. He has earned a Ph.D. in electro-optics, M.E. and B.S. degrees in electrical engineering, and a B.S. in physics. He is an active member of SPIE.

CD-ROM Files

The print version of this book includes a CD-ROM with supplementary material. You can download a .zip file of this material from our website at <http://spie.org/Documents/Publications/PM256CD.zip>.
