

Index

A

Aberdeen Proving Ground, 203
active learning, 184, 192
agglomerative clustering, 171
air, 15
Ampere's law, 10
analytical solutions
 1D, 141
associated Legendre function, 149
axial response, 75

B

Bayes theorem, 107
Bayes, Thomas, 106
Bayesian forms, 106, 195
beam forming, 147
Biot–Savart law, 18
boundary conditions, 11
bucking, 121

C

Camp Butner, 204
Camp San Luis Obispo (SLO), 204
Camp Sibert, 204
capacitance, 33
capacity of statistical learning
 machine, 188
charge density
 electric, 10
 magnetic, 10
 normalized, 152
clustering, 83
coil, 31

compatibility conditions, 16
complementary error function
 (*erfc*), 42, 144
condition number, 98
conditional probability, 107
conditional probability
 distributions, 197
constraints
 in inversion, 95
continuity conditions, 11
convolution, 144
convolution theorem, 70
correlation matrix, 193
Coulomb's law, 10
covariance matrix, 108
cued interrogation, 4, 200
current
 loop, 20
 magnetic, 23
custom training sets, 205
cylinder
 composite, 77
cylindrical geometry, 44

D

detection rate (DR), 200
dielectric constant, 13
differential evolution (DE), 113
diffusion equation, 14
 Helmholtz, 23
diffusion time, 43
dipole
 electric, 22

Hertzian, 22
 magnetic, 22
 direct or explicit interaction models,
 84
 discretization, 7
 displacement currents, 13
 duality, 80

E

eigenvalues, 73
 eigenvalues of \mathbf{P} , 72
 eigenvectors, 73
 electric displacement, 10, 13
 electric field intensity, 10
 electrical conductivity
 soil, 14
 electromotive force (emf), 29
 equivalent object, 153
 error function, 42
 expectation
 probabilistic and statistical, 108
 explosives
 detection, 1
 extrinsic parameters, 91

F

false alarm rate (FAR), 182,
 201
 Faraday's law, 10
 integral expression of, 120
 feature space, 186
 forward problem, 5
 frequency domain (FD), 12
 Ft. Sill, 207
 fully independent superposition
 models, 84

G

Gauss' law
 electric fields, 10
 magnetic fields, 10
 Gaussian distribution 108, 193
 generalization, 186
 generalized likelihood ratio test
 (GLRT), 199

genetic algorithm, 113
 global positioning system (GPS), 126
 real-time kinetic (RTK), 126
 gradient methods, 110
 Green's function
 diffusion equation, 24
 dipole, 22
 matrix, 24
 Poisson equation, 19
 scalar, 19
 tensor, 22, 24
 ground truth (GT), 193
 ground-penetrating radar, 2

H

H-A- Ψ (HAP) method, 159, 163
 handheld instrument, 128
 Helmholtz equation, 12, 16
 hierarchical agglomerative
 clustering, 174
 hyperplane, 188
 hyperspace, 188

I

imaginary natural (resonant)
 frequencies, 80
 impulse response, 121
 independent response models, 84
 indirect interaction models, 84
 inductance, 31
 inertial measurement units (IMUs),
 126
 information theory, 194
 interaction
 phenomenology, 87
 intrinsic parameters, 91
 inverse problem
 direct solution, 5
 fundamentally ill-posed, 8
 general, 5

J

joint diagonalization (JD), 159, 161
 joint probability, 107, 196
 joint probability density function, 197

K

kernel methods, 184
K-means, 172

L

Laplace equation, 15
Lenz's law, 30
library of models, 183
likelihood distributions, 197
likelihood function, 193
likelihood test, 198
line current, 19
line of no discrimination (LOND),
199
live sites, 203

M

magnetic field
intensity, 10
divergence-free, 12
magnetic flux density, 10
magnetic moment density, 21
magnetic monopoles, 12
magnetic susceptibility, 59
magnetization, 27
magnetometers, 1–2
magneto-quasistatics
definition, 13
Mahalanobis distance, 173, 193
Massachusetts Military
Reservation, 207
metal detection, 10
method of auxiliary sources (MAS),
135

N

navigation, 126
noise eigenvalues, 102
noise floor, 106
noise space, 102
nonlinear relations, 93
normalized surface magnetic source
(NSMS) method, 136, 151

O

objective function, 104
oblate spheroids, 76

orthogonal matrix, 36
orthonormalized volume magnetic
source (ONVMS), 166

P

parameterization, 181
partitioning, 184
Pasion and Oldenburg (P–O)
parameterization, 81
pattern matching
signal templates, 183
penalty terms, 105
permeability
magnetic, 10
relative, 11
permittivity, 10
relative, 13
Poisson equation, 19
polarizability, 72
effective, 86
symmetry, 72
tensor, 36
total ONVMS, 170
potential
scalar, 22
vector, 17
primary fields, 27
principal axes, 73
principal directions, 73
prior distribution, 107
prior knowledge, 106
probability density function,
197
prolate spheroids, 76

Q

quality control (QC), 182

R

radar
ground-penetrating, 39
reciprocal media, 71
reciprocity theorem, 71
regularization, 104
relaxation, 47
resistance, 31

resolution
 relative to ill-conditioning,
 101
 resonant frequency, 80
 response rule, 37, 151
 rotation matrix, 36

S

SEA model definition, 150
 secondary fields, 27
 self-inductance, 31
 semi-supervised learning, 184,
 193
 sensors
 handheld, 132
 shell thickness, 40, 43
 signal space, 102
 singularity
 algorithmic, 98
 skin depth, 37
 slab, 41
 infinite, 41
 small penetration approximation
 (SPA), 140
 source density
 normalized, 153
 spheroids
 oblate, 58
 prolate, 58
 standardized excitations approach
 (SEA), 136
 statistical learning machine, 186
 step function, 51
 Stokes theorem, 16
 stop-analysis point, 202
 stop-dig point, 202
 supervised training, 186
 support vector machine (SVM),
 184
 sparseness, 191
 support vectors, 187
 surveying
 detection, 3
 discrimination, 3

T

thin skin approximation (TSA),
 140
 time domain solution, 41
 Time-Domain Electromagnetic
 Multi-sensor Towed Array
 Detection System
 (TEMTADS), 164
 training data
 labeled, 184
 transition times, 47
 transverse response, 75
 transverse-to-axial-response (TAR)
 ratios, 75
 triaxial infinitesimal dipole response
 model (TIDRM), 35
 tuning of weights and penalties,
 106

U

ultra-wide bandwidth (UWB),
 120
 unitary matrix, 103
 unsupervised training, 186
 UXOLab, 205

V

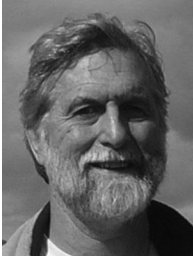

variance, 92
 variance of the data and
 parameters, 93

W

Ward distance, 176
 wave reflections, 16
 wave refractions, 16
 wavenumber, 12
 weight
 regularization, 105
 weighted-pair group method
 average (WPGMA), 177
 wire loop, 30, 48

Y

Yuma Proving Ground, 203

Kevin O'Neill received a B.A. magna cum laude from Cornell University, followed by M.A., M.S.E., and Ph.D. degrees from the Department of Civil Engineering at Princeton University. After an NSF postdoctoral fellowship at the Thayer School of Engineering at Dartmouth College and the U.S. Army Cold Regions Research and Engineering Laboratory (CRREL), he joined CRREL as a Research Civil Engineer. He has been a Visiting Fellow in the Department of Agronomy at Cornell University, a long-time Visiting Scientist at the Center for Electromagnetic Theory and Applications at MIT, and since 1984 has been on the adjunct faculty of the Thayer School. His research has focused on the numerical modeling of porous media transport phenomena, on the remote sensing of geotechnically relevant natural features, and especially on the sensing of buried objects such as unexploded ordnance.
