CONTENTS

Introduction / xv

1 Chapter 1
Introduction to Mechanical Analysis Using Finite Elements / 1
1.1 Integrated Optomechanical Analysis Issues / 1
1.1.1 Integration issues / 1
1.1.2 Example: orbiting telescope / 1
1.1.3 Example: lens barrel / 3
1.2 Elasticity Review / 4
1.2.1 Three-dimensional elasticity / 4
1.2.2 Two-dimensional plane stress / 6
1.2.3 Two-dimensional plane strain / 8
1.2.4 Principal stress and equivalent stress / 9
1.3 Material Properties / 10
1.3.1 Overview / 10
1.3.2 Figures of Merit / 11
1.3.3 Discussion of materials / 14
1.3.4 Common telescope materials / 16
1.4 Basics of Finite Element Analysis / 16
1.4.1 Finite element theory / 16
1.4.2 Element performance / 18
1.4.3 Structural analysis equations / 21
1.4.4 Thermal analysis with finite elements / 22
1.4.5 Thermal analysis equations / 23
1.5 Symmetry in FE Models / 24
1.5.1 General loads / 24
1.5.2 Symmetric loads / 24
1.5.3 Modeling techniques / 27
1.5.4 Axisymmetry / 28
1.5.5 Symmetry: pros and cons / 28
1.6 Model Checkout / 28
1.7 Summary / 30
References / 30
Appendix
A.1 RMS / 31
A.2 Peak-to-Valley / 31
A.3 Orthogonality / 31
A.4 RSS / 32
A.5 Coordinate transformation for vectors / 33
A.6 Coordinate transformation for stresses or materials / 33
A.7 Factor of safety, margin of safety, model uncertainty / 34
## Chapter 2
### Introduction to Optics for Mechanical Engineers / 37

- 2.1 Electromagnetic Basics / 37
- 2.2 Polarization / 38
- 2.3 Rays, Wavefronts, and Wavefront Error / 40
- 2.4 Pointing Error / 41
- 2.5 Optical Aberrations / 42
- 2.6 Image Quality and Optical Performance / 44
  - 2.6.1 Diffraction / 45
  - 2.6.2 Measures of image blur / 45
    - 2.6.2.1 Spot diagram / 46
    - 2.6.2.2 Point spread function and Strehl ratio / 46
    - 2.6.2.3 Encircled energy function / 47
  - 2.6.3 Optical resolution / 47
  - 2.6.4 Modulation transfer function / 48
- 2.7 Image Formation / 50
  - 2.7.1 Spatial domain / 51
  - 2.7.2 Frequency domain / 51
- 2.8 Imaging System Fundamentals / 54
- 2.9 Conic Surfaces / 55
- 2.10 Optical Design Forms / 56
- 2.11 Interferometry and Optical Testing / 57
- 2.12 Mechanical Obscurations / 57
  - 2.12.1 Obscuration periphery, area, and encircled energy / 58
  - 2.12.2 Diffraction effects for various spider configurations / 59
  - 2.12.3 Diffraction spikes / 59
- 2.13 Optical-System Error Budgets / 60

### References / 61

## Chapter 3
### Zernike and Other Useful Polynomials / 63

- 3.1 Zernike Polynomials / 63
  - 3.1.1 Mathematical description / 63
  - 3.1.2 Individual Zernike terms / 64
  - 3.1.3 Standard Zernike polynomials / 66
  - 3.1.4 Fringe Zernike polynomials / 68
  - 3.1.5 Magnitude and phase / 69
  - 3.1.6 Orthogonality of Zernike polynomials / 69
    - 3.1.6.1 Noncircular apertures / 70
    - 3.1.6.2 Discrete data / 71
  - 3.1.7 Computing the Zernike polynomial coefficients / 72
- 3.2 Annular Zernike Polynomials / 74
- 3.3 X-Y Polynomials / 74
- 3.4 Legendre Polynomials / 75
- 3.5 Legendre–Fourier Polynomials / 76
- 3.6 Aspheric Polynomials / 77

### References / 78
Chapter 4
Optical Surface Errors / 81
4.1 Optical-Surface Rigid-Body Errors / 81
  4.1.1 Computing rigid-body motions / 82
  4.1.2 Representing rigid-body motions in the optical model / 83
4.2 Optical-Surface Shape Changes / 84
  4.2.1 Sag displacements / 85
  4.2.2 Surface normal deformations / 86
4.3 Relating Surface Errors to Wavefront Error / 87
  4.3.1 Refractive surfaces / 87
  4.3.2 Reflective surfaces / 88
4.4 Optical Surface Deformations and Zernike Polynomials / 89
  4.4.1 Optical-surface error analysis example / 89
4.5 Representing Elastic Shape Changes in the Optical Model / 91
  4.5.1 Polynomial surface definition / 91
  4.5.2 Interferogram files / 92
  4.5.3 Uniform arrays of data / 93
    4.5.3.1 Grid Sag surface / 94
    4.5.3.2 Interpolation / 94
4.6 Predicting Wavefront Error Using Sensitivity Coefficients and Matrices / 95
  4.6.1 Rigid-body and radius-of-curvature sensitivity coefficients / 96
    4.6.1.1 Sensitivity coefficients example / 96
    4.6.1.2 Computing radius of curvature changes / 97
  4.6.2 Use of Zernike sensitivity coefficients / 98
4.7 Finite-Element-Derived Spot Diagrams / 99
References / 99

Chapter 5
Optomechanical Displacement Analysis Methods / 101
5.1 Displacement FEA Models of Optical Components / 101
  5.1.1 Definitions / 101
  5.1.2 Single-point models / 102
  5.1.3 Models of solid optics / 104
    5.1.3.1 Two-dimensional models of solid optics / 104
    5.1.3.2 Three-dimensional element models of solid optics / 105
  5.1.4 Lightweight mirror models / 108
    5.1.4.1 Two-dimensional equivalent-stiffness models of lightweight mirrors / 108
    5.1.4.2 Three-dimensional equivalent-stiffness models / 114
    5.1.4.3 Three-dimensional plate/shell model / 116
    5.1.4.4 Example: gravity deformation prediction comparison of a lightweight mirror / 117
      5.1.4.4.1 Two-dimensional effective property calculations / 118
      5.1.4.4.2 Three-dimensional effective property calculations / 119
5.1.4.4.3 Three-dimensional plate/shell model effective property calculations / 120
5.1.4.4 Comparison of results / 121
5.1.4.5 Example: Lightweight mirror with significant quilting / 122
5.1.5 Generation of powered optic models / 126
  5.1.5.1 On-axis slumping / 126
  5.1.5.2 Off-axis slumping / 127
  5.1.5.3 Calculation of local segment sag / 131
5.1.6 Symmetry in optic models / 131
  5.1.6.1 Creating symmetric models / 131
  5.1.6.2 Example creation of a symmetric model / 132
  5.1.6.3 Example of symmetry verification check / 134
5.2 Analysis of Surface Effects / 137
  5.2.1 Composite-plate model / 138
  5.2.2 Homogeneous-plate model / 139
  5.2.3 Three-dimensional model / 141
  5.2.4 Example: coating-cure shrinkage / 141
    5.2.4.1 Composite-plate model / 142
    5.2.4.2 Homogeneous-plate model / 142
    5.2.4.3 Three-dimensional model / 143
  5.2.5 Example: Twyman effect / 143
References / 145

<Chapter 6>

Modeling of Optical Mounts / 147

6.1 Displacement Models of Adhesive Bonds / 147
  6.1.1 Elastic behavior of adhesives / 147
  6.1.2 Detailed 3D solid model / 151
    6.1.2.1 Congruent mesh models / 152
    6.1.2.2 Glued contact models / 152
  6.1.3 Equivalent-stiffness bond models / 153
    6.1.3.1 Effective properties for hockey-puck-type bonds / 154
    6.1.3.2 Example: modeling of a hockey-puck-type bond / 159
    6.1.3.3 Effective properties for ring bonds / 161
6.2 Displacement Models of Flexures and Mounts / 162
  6.2.1 Classification of structures and mounts / 162
    6.2.1.1 Classification of structures / 162
    6.2.1.2 Classification of mounts / 163
    6.2.1.3 Mounts in 3D space / 164
  6.2.2 Modeling of kinematic mounts / 165
  6.2.3 Modeling of flexure mounts / 167
    6.2.3.1 Arrangement of strut supports / 167
    6.2.3.2 Optimum radial location of mounts / 169
    6.2.3.3 Modeling of beam flexures / 172
    6.2.3.4 Example: modeling of bipod flexures / 174
    6.2.3.5 Design issues with bipod flexures / 176
6.2.3.6 Modeling of blade flexures / 180
6.3 Modeling of Test Supports / 181
   6.3.1 Modeling of air bags / 182
   6.3.2 Example: test support deformation analysis of a
      nonaxisymmetric optic / 186
   6.3.3 Modeling of V-block test supports / 189
   6.3.4 Modeling of sling and roller-chain test supports / 189
   6.3.5 Example: Comparison of three test supports / 190
6.4 Tolerance Analysis of Mounts / 191
   6.4.1 Monte Carlo analysis / 191
   6.4.2 Example: flatness/coplanarity tolerance of a mirror mount
      / 192
6.5 Analysis of Assembly Processes / 195
   6.5.1 Theory / 195
   6.5.2 Example: assembly analysis of mirror mounting / 197
References / 198

<Chapter 7>
Structural Dynamics and Optics / 199
7.1 Natural Frequencies and Mode Shapes / 199
   7.1.1 Multi-degree-of-freedom systems / 200
7.2 Damping / 201
7.3 Frequency Response Analysis / 202
   7.3.1 Force excitation / 202
   7.3.2 Absolute motion due to base excitation / 205
      7.3.2.1 Absolute motion due to base excitation example / 206
   7.3.3 Relative motion due to base excitation / 207
   7.3.4 Frequency response example / 208
7.4 Random Vibration / 209
   7.4.1 Random vibration in the time domain / 209
   7.4.2 Random vibration in the frequency domain / 210
   7.4.3 Random-vibration SDOF response / 211
      7.4.3.1 Random force excitation example / 211
      7.4.3.2 Base excitation: absolute motion example / 212
      7.4.3.3 Base excitation: relative motion example / 212
   7.4.4 Random vibration design levels / 213
7.5 Vibro-Acoustic Analyses / 214
   7.5.1 Patch method / 214
7.6 Shock Analyses / 216
   7.6.1 Shock response spectrum analyses / 217
   7.6.2 Shock analysis in the time domain / 218
   7.6.3 Attenuation of shock loads / 218
7.7 Line-of-Sight Jitter / 218
   7.7.1 LOS jitter analyses using FEA / 219
   7.7.2 LOS jitter in object and image space / 221
   7.7.3 Optical-element rigid-body motions / 221
   7.7.4 Cassegrain telescope LOS jitter example / 222
## CONTENTS

7.7.5  LOS rigid-body checks / 222
    7.7.5.1 LOS rigid-body checks example / 223
7.7.6  Radial LOS error / 224
7.7.7  Identifying the critical structural modes / 225
7.7.8  Effects of LOS jitter on image quality / 227
    7.7.8.1 Constant-velocity image motion / 228
    7.7.8.2 High-frequency sinusoidal image motion / 229
    7.7.8.3 Low-frequency sinusoidal image motion / 230
    7.7.8.4 Random image motion / 230
7.7.9  Impact of sensor integration time / 231
7.8  Active LOS Stabilization / 233
    7.8.1  Image motion stabilization / 234
    7.8.2  Rigid-body stabilization / 234
7.9  Structural-Controls Modeling / 235
7.10 Vibration Isolation / 236
    7.10.1  Multi-axis vibration isolation / 237
    7.10.2  Vibration isolation system example / 238
    7.10.3  Hexapod vibration isolation systems / 240
    7.10.4  Vibration isolation roll-off characteristics / 240
7.11 Optical Surface Errors Due to Dynamic Loads / 241
    7.11.1  Dynamic response and phase considerations / 241
    7.11.2  Method to compute optical surface dynamic response / 242
    7.11.3  Dynamic surface response and modal techniques / 243
    7.11.4  System wavefront error due to dynamic loads / 244
References / 245

### Chapter 8

#### Mechanical Stress and Optics / 249

8.1 Stress Analysis Using FEA / 249
    8.1.1  Coarse FEA models and stress concentration factors / 250
    8.1.2  FEA post-processing / 250
8.2 Ductile Materials / 251
    8.2.1  Microyield / 251
    8.2.2  Ultimate strength / 252
8.3 Analysis of Brittle Materials / 252
    8.3.1  Fracture toughness / 253
    8.3.2  FEA methods to compute the stress intensity / 254
8.4 Design Strength of Optical Glass / 254
    8.4.1  Surface flaws / 255
    8.4.2  Controlled grinding and polishing / 255
    8.4.3  Inert strength / 256
        8.4.3.1  Residual stress and inert strength / 256
        8.4.3.2  Inert strength based on material testing and Weibull statistics / 256
    8.4.4  Environmentally enhanced fracture / 258
        8.4.4.1  Crack growth studies / 258
        8.4.4.2  Static and dynamic fatigue testing / 259
8.4.4.3 Lifetime and time-to-failure analyses / 260
8.4.4.4 Lifetime prediction and probability of failure / 262
8.4.4.5 Effects of residual stress on time-to-failure / 263
8.4.4.6 BK7 design strength example / 264
8.4.5 Proof testing / 264
8.4.6 Cyclic fatigue / 265
8.5 Stress Birefringence / 265
  8.5.1 Mechanical stress and the index ellipsoid / 266
  8.5.2 Stress birefringence for isotropic materials / 267
  8.5.3 Stress-optical coefficients / 270
  8.5.4 Computing stress birefringence for nonuniform stress distributions / 271
  8.5.5 Stress birefringence example / 274
  8.5.6 Stress birefringence and optical modeling / 276
References / 277

<Chapter 9>
Optothermal Analysis Methods / 279
  9.1 Thermal Design and Analysis / 279
  9.2 Thermo-Elastic Analysis / 280
    9.2.1 Thermal strain and the coefficient of thermal expansion / 280
    9.2.2 CTE inhomogeneity / 281
  9.3 Index of Refraction Changes with Temperature / 283
  9.4 Effects of Temperature on Simple Lens Elements / 285
    9.4.1 Focus shift of a doublet lens example / 286
    9.4.2 Radial gradients / 287
  9.5 Thermal Response Using Optical Design Software / 288
    9.5.1 Representing OPD maps in the optical model / 289
  9.6 Thermo-Optic Analysis of Complex Temperature Fields / 290
    9.6.1 Thermo-optic finite element models / 290
      9.6.1.1 Multiple reflecting surfaces / 291
      9.6.2 Thermo-optic errors using integration techniques / 291
      9.6.3 User-defined surfaces / 293
  9.7 Bulk Volumetric Absorption / 293
  9.8 Mapping of Temperature Fields from the Thermal Model to the Structural Model / 294
    9.8.1 Nearest-node methods / 295
    9.8.2 Conduction analysis / 295
    9.8.3 Shape function interpolation / 296
  9.9 Analogous Techniques / 297
    9.9.1 Moisture absorption / 298
    9.9.2 Adhesive curing / 298
References / 298

<Chapter 10>
Analysis of Adaptive Optics / 301
  10.1 Introduction / 301
10.2 Method of Simulation / 302
  10.2.1 Determination of actuator inputs / 303
  10.2.2 Characterization metrics of adaptive optics / 304
    10.2.2.1 Example: adaptive control simulation of a mirror segment / 305
10.3 Use of Augment Actuators / 307
  10.3.1 Example of augment actuators / 308
10.4 Slope Control of Adaptive Optics / 309
10.5 Actuator Failure / 309
10.6 Actuator Stroke Limits / 311
10.7 Actuator Resolution and Tolerancing / 312
  10.7.1 Example of actuator resolution analysis / 313
10.8 Design Optimization of Adaptively Controlled Optics / 314
  10.8.1 Adaptive control simulation in design optimization / 314
    10.8.1.1 Example: Structural design optimization of an adaptively controlled optic / 315
  10.8.2 Actuator placement optimization / 317
    10.8.2.1 Example: Actuator layout optimization of a grazing incidence optic / 318
10.9 Stressed-Optic Polishing / 319
  10.9.1 Adaptive control simulation in stressed-optic polishing / 319
  10.9.2 Example: Stressed-optic polishing of hexagonal array segments / 320
10.10 Analogies Solved via Adaptive Tools / 322
  10.10.1 Correlation of CTE variation / 323
  10.10.2 Mount distortion / 324
References / 324

**Chapter 11**
Optimization of Optomechanical Systems / 327
  11.1 Optimization Approaches / 328
  11.2 Optimization Theory / 329
  11.3 Structural Optimization of Optical Performance / 333
    11.3.1 Use of design response equations in the FE model / 333
    11.3.2 Use of external design responses in FEA / 335
  11.4 Integrated Thermal-Structural-Optical Optimization / 336
References / 337

**Chapter 12**
Superelements in Optics / 339
  12.1 Overview / 339
  12.2 Superelement Theory / 339
    12.2.1 Static analysis / 340
    12.2.2 Dynamic analysis / 341
      12.2.2.1 Guyan reduction / 341
      12.2.2.2 Component mode synthesis / 341
    12.2.3 Types of superelements / 342
12.2.3.1 Conventional superelement / 342
12.2.3.2 External superelement / 343
12.3 Application to Optical Structures / 343
  12.3.1 Kinematic mounts / 343
  12.3.2 Segmented mirrors / 343
12.4 Advantages of Superelements / 344
12.5 Telescope Example / 344
References / 345

Chapter 13

Integrated Optomechanical Analysis of a Telescope / 347
  13.1 Overview / 347
  13.2 Optical Model Description / 348
  13.3 Structural Model Description / 349
  13.4 Optimizing the PM with Optical Metrics / 351
  13.5 Line-of-Sight Calculations / 352
  13.6 On-Orbit Image Motion Random Response / 352
  13.7 On-Orbit Surface Distortion in Random Response / 355
  13.8 Detailed Primary Mirror Model / 356
  13.9 RTV vs Epoxy Bond / 359
  13.10 Gravity Static Performance / 360
  13.11 Thermo-Elastic Performance / 362
  13.12 Polynomial Fitting / 364
  13.13 Assembly Analysis / 365
  13.14 Other Analyses / 366
  13.15 Superelements / 367
References / 369

Chapter 14

Integrated Optomechanical Analyses of a Lens Assembly / 371
  14.1 Double Gauss Lens Assembly / 371
    14.1.1 Thermal analysis / 372
    14.1.2 Thermo-elastic analysis / 373
    14.1.3 Stress birefringence analysis / 374
    14.1.4 Thermo-optic analysis / 374
    14.1.5 Optical analysis / 375
  14.2 Seven-Element Lens Assembly / 378

Index / 381
Introduction

Optomechanical engineering is the application of mechanical engineering principles to design, fabricate, assemble, test, and deploy an optical system that meets performance requirements in the service environment. The challenge of optomechanical engineering lies in preserving the position, shape, and optical properties of the optical elements with specified tolerances typically measured in microns, microradians, and fractions of a wavelength.

Optomechanical analyses are an integral part of the optomechanical engineering discipline to simulate the mechanical behavior and performance of the optical system. These analyses include a broad range of thermal, structural, and mechanical analyses that support the design of optical mounts, metering structures, mechanisms, test fixtures, and more. This includes predicting the performance, dimensional stability, and structural integrity of optomechanical designs subject to internal mechanical loads and often harsh environmental disturbance, including inertial, pressure, thermal, and dynamic disturbance. Designs must provide for positive margin against failure modes that include yielding, buckling, ultimate failure, fatigue, and fracture.

Analysis starts with first-order estimates using analytical solutions based on classic elasticity and heat transfer theory. These closed-form solutions provide rapid estimates of structural and thermal behavior and an understanding of the governing parameters controlling the response. Finite element analysis (FEA) methods are widely used to provide more-accurate and higher-fidelity mechanical response predictions. Models of varying complexity may be developed by discretizing the structure into one-, two-, or three-dimensional elements to meet both efficiency and accuracy requirements. Thermal analysis models use both finite element methods and finite difference techniques to predict the thermal behavior of optical systems. Models are developed to predict thermal response quantities such as temperature distributions and heat fluxes that account for conduction, convection, and radiation modes of heat transfer.

Integrated optomechanical analysis involves the coupling of the structural, thermal, and optical simulation tools in a multi-disciplinary process commonly referred to as structural-thermal-optical performance or STOP analyses. The benefit of performing integrated analyses is the ability to provide insight into the interdisciplinary design relationships of thermal and structural designs and their impact through a deterministic assessment of optical performance. Engineering decisions during both the conceptual and execution stages of a program can then be based on high-fidelity performance simulations that are combined with program performance and reliability requirements, risk tolerance, schedule, and cost objectives to optimize the overall system design.

Integrated optomechanical analyses benefit optical system concept development by providing a rigorous and quantitative evaluation to explore the mission and design-trade spaces. The benefits of a wide variety of optical design configurations can be evaluated to account for factors such as the mechanical
design, pointing control and stability, thermal management, and materials selection for architecture down select.

During the execution stages of a program, integrated optomechanical analyses capture complex environmental conditions and concurrent disturbances. These analyses can be performed to compute performance as a function of time such as during operational scenarios that provide insights beyond which can be captured by a roll-up of static error-budget contributions. The simulations can be used in conjunction with numerical algorithms to optimize the design, serve as a predictive test bed for system-performance predictions, or provide for diagnostic evaluations of systems underperforming in the field.

The development and use of integrated optomechanical analyses has significantly increased over the past decade to support the ever-increasing challenges in optical system design, leveraging advances in computational resources. Government organizations have employed integrated tools in support of large-scale programs and advanced technologies, including space- and ground-based telescopes and high-powered beam systems. In addition, commercial organizations have sought to improve their effectiveness and efficiency in the design of optical systems through the application and development of custom-integrated optomechanical software tools. A variety of commercial software has been developed to provide an integrated analysis capability to the broader community.

Several approaches have been taken to integrate or couple the thermal, structural, and optical modeling tools. The “bucket brigade” approach relies on scripts to format and pass data between software tools. The “wrapper” approach uses custom-developed software to automate the data-sharing process. Fully integrated software tools offer the ability to model each discipline in a single, stand-alone modeling environment. Each of these approaches has its advantages and disadvantages, and one may be more appropriate over another for a given application or organization.

An essential piece of successful optomechanical analyses is the verification and validation of the models. Verification may be considered as the assessment of the numerical correctness of the model, i.e., ensuring that the models and the software do not have errors. Analytical solutions, stick models, check-out runs, and crawl-walk-run strategies are all verification methods to help ensure that a model is sound.

Validation may be considered as the assessment of how well the model represents the physical behavior of the hardware. Model validation via testing is performed at various stages of a design cycle. Early testing at the component and subassembly level can be used to validate basic physics and model uncertainties. System-level validation supports requirements verification and provides confidence in analyses that are used to extrapolate performance outside of a limited test domain.

This book serves as a compilation of many of the analyses and integrated methods that the authors have employed and developed in their collective experience supporting the development of optical systems. There are 14 chapters
that address key aspects of optomechanical analysis, including the detailed use of FEA methods and techniques to integrate and couple the thermal, structural, and optical analysis tools. There are additional disciplines involved in optical system engineering that may also be incorporated in a broader integrated analysis process that includes controls, radiometry, stray light, and aerodynamics, whose discussions are beyond the scope of this text.

Chapter 1 starts with an introduction to mechanical analysis using finite element methods and considerations in the integration of thermal, structural, and optical analyses. Included is a review of mechanical engineering basics, an overview of materials commonly used in optical systems, and finite element theory. A section on FEA modeling checks is presented that underscores the importance of verifying models and analyses.

Chapter 2 presents the fundamentals of optics, common optical performance metrics, and image formation. Included are discussions on polarized light, diffraction, conic surfaces, the impact of mechanical obscurations on optical performance, and optical system error budgets. This chapter serves as the basis of how mechanical perturbations, including optical surface errors and index of refraction changes due to temperature and stress, affect the performance of optical systems.

Chapter 3 provides an overview of Zernike polynomials and their utility in representing discrete data such as finite element results and as a means of data transfer from the thermal and structural tools into optical design software. Other relevant polynomial forms are also discussed.

Chapter 4 presents optical-surface-error analyses and methods to predict optical performance that account for FEA-derived optical surface errors. Two methods using optical sensitivity coefficients are discussed to predict wavefront error as a function of both rigid-body errors and higher-order elastic surface deformations. Use of optical sensitivity coefficients are beneficial early in the design stages for “closed-loop” analyses that allow mechanical engineers to predict optical performance as a function of mechanical design variables and account for the effects of environmental disturbances. The integration of FEA-derived optical surface errors within commercially available optical design software enables the development of a “perturbed” optical model, from which the full range of optical simulations and performance evaluations may be exercised to assess thermal and structural effects.

Chapters 5 and 6 discuss finite element model construction and analysis methods for predicting displacements of optical elements and support structures. Specific topics include modeling methods for individual optical components, various techniques to model lightweight mirrors, methods to create powered optical surfaces, use of symmetry for efficient modeling practices, and methods to analyze the effects of a variety of surface coating effects. Chapter 6 introduces kinematic mounting principles and focuses on the modeling of optical mounts, adhesive bonds, flexures, test supports, and the use of Monte Carlo methods to evaluate the effects of optical mount misalignments.
For many of the topics discussed in Chapters 5 and 6, analysis and modeling approaches range from first-order to detailed, high-fidelity simulations. The engineer may adopt an analysis strategy where the model fidelity maps to design maturity and requirements accuracy. Low-fidelity models are performed early in the design stages for the “80% solution.” These models are easily modified as the design evolves to support design trades and sensitivity studies. High-fidelity models that are more time consuming to build, modify, run, and post-process can be developed when the design has matured to provide high accuracy.

Chapter 7 provides an overview of structural dynamics, including normal modes, damping, harmonic, random, vibro-acoustic, and shock analyses. Analysis techniques are presented to predict pointing errors and LOS jitter using FEA and optical sensitivity coefficients, including the subsequent impact on optical system performance. Strategies and techniques to reduce the LOS jitter, including the identification of critical modes in the mechanical structure, the use of passive and active stabilization techniques, and the impact of sensor integration time, are included in the discussion. For large-aperture optical systems, methods are presented to predict optical surface distortions and wavefront error due to dynamic excitation of the optical surfaces.

Chapter 8 focuses on mechanical stress. Stress needs to be managed for several reasons in an optical system including structural integrity where excessive stress can lead to permanent misalignments or structural failure of optical elements, mounts, and support structures. An introduction to stress analysis using FEA is presented along with methods to predict the design strength of optical glass. The latter half of Chapter 8 describes the phenomenon of stress birefringence and presents analysis techniques to account for the effects of mechanical stress on optical performance. First-order estimates are provided using the photo-elastic equations along with more involved methods to compute optical performance metrics such as retardance and polarization errors due to complex mechanical stress states.

Chapter 9 presents optothermal analysis methods, including thermo-elastic and thermo-optic modeling techniques. This class of analyses helps drive thermal management strategies used to preserve optical-element surface errors and index-of-refraction changes in the presence of temperature changes. Methods to compute externally derived OPD maps using interferogram files and phase surfaces along with techniques to map temperatures between thermal and structural models that have varying mesh densities are presented. This latter process is a critical step in the STOP modeling effort and is often a technical challenge for program teams. Additional topics include a discussion on bulk volumetric absorption and the use of thermal analysis software to perform analogous analyses, including moisture effects and adhesive curing.

Chapter 10 provides an introduction to the analysis of adaptive optics. Adaptive optic concepts and definitions, including correctability and influence functions, are discussed along with the mathematics to compute actuator motion to minimize optical surface deformations. Practical details on adaptive optics are discussed, including predicting residual surface errors due to actuator failure,
stroke limits, resolution, and tolerancing are also presented. Examples are provided on the design of adaptive optics and actuator placement using design optimization methods. Additional topics in the chapter include stress-optic polishing and the use of adaptive tools to solve an analogous class of problems. This latter topic utilizes the same mathematical process for determining actuator inputs to predict the combination of a set of predefined disturbances to best match any arbitrary surface error. Examples are presented that solve for the combination of mount distortions and CTE variations to match interferometric test data.

Chapter 11 discusses structural optimization theory and applications. Numerical optimization consists of powerful techniques that enable a more-efficient evaluation of a broad design space beyond which may be evaluated via parametric design trades. The chapter discusses the use of optical performance metrics in structural optimization simulations and also provides a general discussion on multidisciplinary optimization.

Chapter 12 presents the use of FEA substructuring techniques for optical systems. The use of substructuring or superelements provides many benefits in detailed FEA simulations to provide for a more rapid turnaround of results for greater insight and impact. Superelement theory is presented along with common types of superelements. Examples of modeling kinematic mounts and segmented optical systems using superelements are presented.

The final two chapters present examples of the optomechanical and integrated analyses discussed in the previous chapters. Chapter 13 addresses a variety of analyses on a reflective telescope, and Chapter 14 details the integrated optomechanical analysis of two lens assemblies.
