<b>I THEORY</b>	<b>1</b>
<b>1 Introduction to Light and Optical Systems</b>	<b>3</b>
1.1 What Is Light?	3
1.1.1 Light as electromagnetic waves	4
1.1.2 Light as particles: photons	4
1.1.3 Wave–particle duality of light	6
1.2 How Do Light Sources Produce Light?	6
1.2.1 Explanation by electromagnetic wave theory	7
1.2.2 Explanation by quantum theory	7
1.3 Theories of Light: An Overview	9
1.3.1 Geometrical optics	9
1.3.2 Wave optics	10
1.3.3 Quantum optics	11
1.4 Overview of Optical Systems	12
1.4.1 What are optical systems?	12
1.4.2 Main types of optical systems	12
1.4.2.1 Optical imaging systems	12
1.4.2.2 Optical systems for energy collection	13
References	15
<b>2 Geometrical Optics</b>	<b>17</b>
2.1 Definition of the Index of Refraction	19
2.2 Origin of the Index of Refraction	20
2.3 Reflection and Refraction of Light	21
2.3.1 Sign conventions	21
2.3.2 Laws of reflection and refraction	22
2.3.3 Total internal reflection	25
2.3.4 Dispersion of light	26
2.4 Perfect Optical Imaging Systems	27
2.4.1 Imaging concept	27
2.4.2 Cardinal points and planes in imaging systems	28

2.4.3	Stops and pupils in imaging systems	33
2.4.4	Some useful formulas	36
2.4.4.1	Object–image relationship	37
2.4.4.2	Magnifications	37
2.4.4.3	Lagrange invariant	39
	2.4.4.3.1 Lagrange invariant: an incarnation of the uncertainty principle in geometrical optics	40
2.5	Raytracing	41
2.5.1	Paraxial raytracing	41
2.5.1.1	Matrix approach to paraxial raytracing	45
2.5.1.2	Examples	48
	2.5.1.2.1 Single lenses	48
	2.5.1.2.2 Compound lenses	50
2.5.2	Diffraction raytracing	51
2.6	Geometrical Aberrations	53
2.6.1	Primary aberrations	54
2.6.1.1	Spherical aberration	55
2.6.1.2	Coma	57
2.6.1.3	Astigmatism	58
2.6.1.4	Curvature of field	59
2.6.1.5	Distortion	60
2.6.2	High-order aberrations	61
2.6.3	Chromatic aberrations	61
2.6.3.1	Example A: The principle of the positive achromatic doublet	62
2.6.3.2	Example B: Binary optics used for chromatic aberration correction in the IR spectrum	63
2.7	General Procedure for Designing Optical Imaging Systems	64
2.7.1	First-order design of optical imaging systems	65
2.7.2	Detailed design of optical imaging systems	67
2.7.2.1	Configuration optimization	67
2.7.2.2	Tolerance analysis	68
2.7.3	Design of an achromatic doublet	69
	References	75
<b>3</b>	<b>Wave Optics</b>	<b>77</b>
3.1	Electromagnetic Theory of Optics	77
3.1.1	Maxwell's equations	77
3.1.2	Wave equations	79
3.1.2.1	Vector wave equation	79
3.1.2.2	Scalar wave equation	80
	3.1.2.2.1 The Helmholtz equation	80

3.1.3	Light waves and their characteristics	81
3.1.3.1	Plane waves	81
3.1.3.2	Spherical waves	82
3.1.3.3	Characteristics of light waves	83
3.2	Diffraction	85
3.2.1	Rayleigh–Sommerfeld diffraction formula	86
3.2.2	Fresnel approximation	88
3.2.3	Fraunhofer approximation	92
3.2.4	Examples	93
3.2.4.1	Circular aperture	93
3.2.4.2	Rectangular aperture	96
3.2.4.3	Other aperture shapes	98
3.3	Interference	99
3.3.1	Coherence	99
3.3.1.1	Temporal coherence	103
3.3.1.2	Spatial coherence	104
3.3.2	Examples	107
3.3.2.1	Two-beam interference	107
3.3.2.2	Multibeam interference	111
3.3.2.3	Fourier transform spectrometer	113
3.3.2.4	Stellar interferometer	115
3.4	Fourier Optics: An Introduction	116
3.4.1	Fourier transform	116
3.4.2	Angular spectrum expansion	117
3.4.3	Fourier transform in optics	122
3.4.3.1	Phase transformation of a positive lens	122
3.4.3.2	Fourier transform by a lens	123
3.4.4	Examples of optical Fourier spectra	125
3.4.4.1	Point sources	125
3.4.4.2	Plane waves	126
3.4.4.3	Slits	128
3.4.4.4	Circular apertures	130
3.4.4.5	Sinusoidal amplitude gratings	131
3.4.4.6	Phase-contrast microscopes	132
3.4.5	Formulas governing image formation in Fourier optics	133
3.4.5.1	Point spread functions	133
3.4.5.2	Image formation with coherent illumination	134
3.4.5.3	Image formation with incoherent illumination	135
3.5	Wavefront Aberrations	136
3.5.1	Optical path difference	137
3.5.1.1	Example: Light traveling in different media of the same thickness	137

3.5.2	Peak-to-valley and root-mean-square values of a wavefront aberration	138
3.5.3	Zernike representation of wavefront aberrations	140
3.6	Resolution Limits of Optical Imaging Systems	142
	References	143

# Preface

Optical systems have such broad applications that they can be found in countless scientific disciplines, industry, and everyday life. Many scientists and engineers whose work involves optical systems can use commercial off-the-shelf systems or build an optical system from the level of optical components. However, scientists and engineers who need to build customized optical systems must be able to understand the working principles of these systems and the components they comprise. With this requirement in mind, the goal of this book is to guide readers in acquiring an understanding of how and why optical systems and their related optical components work. The prerequisite for understanding optical systems is for readers to understand the optical theories involved in the systems. Then, armed with this understanding of the theory, readers can learn to analyze and understand these systems by studying some practical optical systems. An understanding of optical theories together with an examination of some practical optical systems will boost the reader to a higher level of expertise in building optical systems.

Having worked in the field of optics for many years, we believe that a clear, global picture of optical theory is important for understanding optical systems, especially for conceiving new optical systems, which is our ultimate goal for readers. We also believe that the most effective and quickest way for readers to acquire the ability to analyze and understand optical systems is by studying examples of some typical optical systems. Based on the above tenets, this book consists of two parts: optical theory, involving mainly classical optics; and case studies of optical systems, involving mainly imaging systems. Three practical optical systems are provided to show readers how to analyze and understand the working principles of optical systems by means of optical theories. We expect readers to not only master the basic methods used in building the optical systems in the examples presented in the book, but also to be able to apply these methods in new situations and to conceive their own systems. This is where real understanding is demonstrated.

The book is divided into two parts. Part I on Theory (Chapters 1–3) gives an introduction to geometrical optics and wave optics, and some concepts of quantum optics and statistical optics. Chapter 1 presents an overview of the properties and generation of light, a brief summary of optical theories, and

some optical systems. Chapter 2 focuses on geometrical optics. Included in this chapter are the origin of the index of refraction, laws of reflection and refraction, perfect optical imaging systems, raytracing, geometrical aberrations, and design of an achromatic doublet. Chapter 3 presents descriptions of wave optics. Topics covered are Maxwell's equations, wave equations, light waves and their characteristics, diffraction, interference, Fourier optics, wavefront aberrations, and resolution limits of optical imaging systems. Part II on case studies (Chapters 4–7) describes some important and commonly used optical elements and presents three examples of practical optical systems. Commonly used optical components are introduced in Chapter 4. Chapter 5 covers confocal microscopes, whose principle can be explained mainly using geometrical optics. Chapter 6 describes an online co-phasing optical system for segmented mirrors. The principle of the co-phasing optical system is expounded mainly by wave optics. Finally, in Chapter 7, a comprehensive example concerning an adaptive optics system designed and implemented by the adaptive optics group led by Sijiong Zhang is explained using both geometrical and wave optics.

The advanced mathematics needed for readers of this book are calculus, Fourier transforms, and matrix operations. The book can be used as a textbook or reference for students majoring in optics or physics. It can also serve as a reference for scientists, engineers, and researchers whose work involves optical systems.

We would like to express our sincere thanks to the numerous people who have contributed to this book. We are very grateful to many colleagues of Nanjing Institute of Astronomical Optics & Technology (NIAOT), Chinese Academy of Sciences, especially, the director of NIAOT, Prof. Yongtian Zhu, who supported us in writing this book. We thank Prof. Dong Xiao for closely reading the manuscript and giving many useful suggestions during the revision of the manuscript. We thank Dr. Yanting Lu for participating in the revision of the manuscript and writing its appendices. We also thank Dr. Bangming Li for writing part of Chapter 7. Additionally, we would like to express our sincere appreciation to SPIE, especially to Senior Editor Dara Burrows, and to the anonymous reviewers for their helpful and constructive suggestions to improve this book. Finally, the first author, Sijiong Zhang, would like to express his thanks to Prof. Alan Greenaway at Heriot-Watt University, Edinburgh for guiding him into the field of adaptive optics.
