**Paper Numbering:** Proceedings of SPIE follow an e-First publication model, with papers published first online and then in print and on CD-ROM. Papers are published as they are submitted and meet publication criteria. A unique, consistent, permanent citation identifier (CID) number is assigned to each article at the time of the first publication. Utilization of CIDs allows articles to be fully citable as soon as they are published online, and connects the same identifier to all online, print, and electronic versions of the publication. SPIE uses a six-digit CID article numbering system in which:

- The first four digits correspond to the SPIE volume number.
- The last two digits indicate publication order within the volume using a Base 36 numbering system employing both numerals and letters. These two-number sets start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B ... 0Z, followed by 10-1Z, 20-2Z, etc.

The CID Number appears on each page of the manuscript. The complete citation is used on the first page, and an abbreviated version on subsequent pages. Numbers in the index correspond to the last two digits of the six-digit CID Number.

# **Introduction**

Recent advances in integrated optics have created the possibility of entertaining the implementation of complex functionalities into optoelectronics (OE) integrated circuits. OE circuits have the potential to be miniaturized and mass-produced at an affordable cost for many applications and markets, including telecommunications, optical interconnects, medical screening, and biological and chemical sensing, to name a few. Recent developments in diverse areas such as light sources, modulators, switches, detectors, photonic crystals, waveguide structures, resonators, sensors, and various sub-systems, indicate that integrated optics remains an extremely active and firmly established research field.

This conference on Integrated Optics: Physics and Simulations is part of the SPIE 2013 Optics and Optoelectronic Symposium. It focuses on the physics, design and simulation of integrated optical structures, devices and systems. The conference aims to provide an international forum for researchers from academia, industry and government laboratories for sharing the latest advancements relevant to integrated optics physics, design and simulations. The conference covers a wide range of topics, including: simulation and design of optoelectronic devices; waveguide photonic bandgap engineering and microcavities; passive and active waveguide devices; diffractive and subwavelength structures; integrated optical circuits for datacom, WDM networks and coherent communications; waveguide based light sources; photodetectors, modulators, amplifiers, wavelength converters, switches, couplers, resonators, filters and subsystems; waveguide devices for aerospace applications and defence; optical interconnects; photonic design automation, manufacturing and verification tools; and novel algorithms and photonic CAD software for photonics and integration with electronics.

These Conference Proceedings include original research papers presented at the conference, including a number of invited papers from leading authorities in the field. We thank all the contributors for submitting their interesting work. We hope that these Integrated Optics: Physics and Simulation Conference Proceedings will prove valuable to those working in integrated optics and will help advance research in this field.
