Volume 7023

Proceedings of SPIE, 0277-786X, v. 7023

SPIE is an international society advancing an interdisciplinary approach to the science and application of light.

The papers included in this volume were part of the technical conference cited on the cover and title page. Papers were selected and subject to review by the editors and conference program committee. Some conference presentations may not be available for publication. The papers published in these proceedings reflect the work and thoughts of the authors and are published herein as submitted. The publisher is not responsible for the validity of the information or for any outcomes resulting from reliance thereon.

Please use the following format to cite material from this book:

Author(s), "Title of Paper," in *Quantum Informatics 2007*, edited by Yuri I. Ozhigov, Proceedings of SPIE Vol. 7023 (SPIE, Bellingham, WA, 2008) Article CID Number.

Copying of material in this book for internal or personal use, or for the internal or personal use of specific clients, beyond the fair use provisions granted by the U.S. Copyright Law is authorized by SPIE subject to payment of copying fees. The Transactional Reporting Service base fee for this volume is \$18.00 per article (or portion thereof), which should be paid directly to the Copyright Clearance Center (CCC), 222 Rosewood Drive, Danvers, MA 01923. Payment may also be made electronically through CCC Online at copyright.com. Other copying for republication, resale, advertising or promotion, or any form of systematic or multiple reproduction of any material in this book is prohibited except with permission in writing from the publisher. The CCC fee code is 0277-786X/08/\$18.00.

Printed in the United States of America.

Publication of record for individual papers is online in the SPIE Digital Library.

SPIE 
Digital Library

SPIDigitalLibrary.org

Paper Numbering: Proceedings of SPIE follow an e-First publication model, with papers published first online and then in print and on CD-ROM. Papers are published as they are submitted and meet publication criteria. A unique, consistent, permanent citation identifier (CID) number is assigned to each article at the time of the first publication. Utilization of CIDs allows articles to be fully citable as soon they are published online, and connects the same identifier to all online, print, and electronic versions of the publication. SPIE uses a six-digit CID article numbering system in which:

- The first four digits correspond to the SPIE volume number.
- The last two digits indicate publication order within the volume using a Base 36 numbering system employing both numerals and letters. These two-number sets start with 00, 01, 02, 03, 04, 05, 06, 07, 08, 09, 0A, 0B ... 0Z, followed by 10-1Z, 20-2Z, etc.

The CID number appears on each page of the manuscript. The complete citation is used on the first page, and an abbreviated version on subsequent pages. Numbers in the index correspond to the last two digits of the six-digit CID number.

Contents

v	<i>Conference Committee</i>
vii	<i>Introduction</i>
7023 02	Quantum computation and hidden variables [7023-01] V. V. Aristov, A. V. Nikulov, Institute of Microelectronics Technology (Russia)
7023 03	Quantum theory with hidden variables and dynamic chaos [7023-02] Yu. I. Bogdanov, Institute of Physics and Technology (Russia)
7023 04	Quantum computations on ion traps [7023-03] A. Burkov, Y. Ozhigov, Moscow State Univ. (Russia)
7023 05	Relative coordinates of coherent electron pair [7023-04] C. V. Usenko, N. O. Cherkashyna, National Taras Shevchenko Univ. of Kyiv (Ukraine)
7023 06	Non-multiple non-equidimensional bases and unsharp measurements [7023-05] D. V. Dodin, I. G. Kovalenko, Volgograd State Univ. (Russia)
7023 07	Probabilistic simulation of quantum states [7023-06] Yu. P. Rybakov, Peoples' Friendship Univ. of Russia (Russia); T. F. Kamalov, Moscow State Open Univ. (Russia)
7023 08	Can the mathematical formalism of quantum mechanics be applied to psychology? [7023-07] A. Khrennikov, Univ. of Växjö (Sweden)
7023 09	Quantum averages from Gaussian random fields at the Planck length scale [7023-08] A. Khrennikov, Univ. of Växjö (Sweden)
7023 0B	An investigation of the antiferromagnet-based NMR quantum register in inhomogeneous magnetic field [7023-10] A. A. Kokin, Institute of Physics and Technology (Russia); V. A. Kokin, Institute of Radioengineering and Electronics (Russia)
7023 0C	Non-locality: Mystery or myth? [7023-11] A. F. Kracklauer, Bauhaus Univ. (Germany)
7023 0D	Hidden time interpretation of quantum mechanics and no-protocol argument [7023-12] P. V. Kurakin, Moscow Institute of Physics and Technology (Russia)
7023 0E	Thermal entanglement in a case of two spin temperatures [7023-13] M. Kutcherov, Polytechnic Institute of Siberian Federal Univ. (Russia)

- 7023 OF **On degenerate bispinor states of the Dirac wave equation system for an electron in an electrostatic field** [7023-14]
B. K. Novosadov, M.V. Lomonosov Moscow State Univ. (Russia)
- 7023 OG **Macroscopic wavefunction for ensemble of ultracold atoms trapped in optical labyrinth** [7023-15]
A. Yu. Okulov, A.M. Prokhorov General Physics Institute (Russia)
- 7023 OH **Numerical method of entangled state selection in association of molecules** [7023-16]
K. S. Arakelov, Yu. I. Ozhigov, Moscow State Univ. (Russia)
- 7023 OI **Influence of surrounding spin environment on two-spin system ESR spectra** [7023-17]
S. N. Dobryakov, V. V. Privezentsev, Institute of Physics and Technology (Russia)
- 7023 OJ **Geometric information in eight dimensions vs. quantum information** [7023-18]
V. I. Tarkhanov, St. Petersburg State Polytechnic Univ. (Russia); M. M. Nesterov, St. Petersburg Institute for Informatics and Automation (Russia)
- 7023 OK **Problem of detection of Rydberg atoms and quantum information processing** [7023-19]
D. B. Tretyakov, I. I. Ryabtsev, I. I. Beterov, V. M. Entin, Institute of Semiconductor Physics (Russia)
- 7023 OL **Application of superconducting quantum interferometer in quantum computer development** [7023-20]
A. I. Golovashkin, A. L. Karuzskiy, Lebedev Physical Institute (Russia); A. A. Orlikovskiy, V. V. Privezentsev, Institute of Physics and Technology (Russia); A. M. Tshovrebov, Lebedev Physical Institute (Russia)
- 7023 OM **Optically driven nanostructures as the basis for large-scale quantum computing** [7023-21]
A. V. Tsukanov, Institute of Physics and Technology (Russia)
- 7023 ON **Selective control of states of a three-level quadrupolar nucleus using non-selective radio-frequency pulses** [7023-22]
V. E. Zobov, L.V. Kirensky Institute of Physics (Russia); V. P. Shauro, Siberian Federal Univ. (Russia)

Introduction

Quantum Informatics - 2007 (QI-2007) is the forth international symposium on quantum informatics held in Russia. The symposium was organized by the Faculty of Computational Mathematics and Cybernetics of Moscow State University and the Institute of Physics and Technology of Russian Academy of Sciences, and was sponsored by Russian Fund for Fundamental Research (RFFI, grants 07-01-06114-g, 06-01-00494-a), and NIX Computer Company (grant #F793/8-05).

QI-2007 demonstrated the substantial progress and new trends in quantum informatics that arose in the past two years. At first we saw the continuing development of quantum cryptography in Russia, which made it possible to characterize quantum informatics as a new perspective in IT technologies. The quantum channel, constructed by Sergei Molotkov (MSU, ISSP) began in Moscow. We expect further distribution of his scheme among the top level of business society and state organizations of Russia. Molotkov's recent advantage is the establishing of the eavesdropping strategy, breaking quantum channel security with 11% noise. This strategy can be called the collective attack. It is characterized by the usage of quantum memory in eavesdropping. The former 11% border of admissible noise in quantum channel has been thus proved to be exact.

New investigations in quantum computer technology on solid state quantum dots have been represented by Alexander Tsukanov and Alexander Kokin (FTIAN). An ion trap quantum computer abstract model was investigated by Alexander Burkov (MSU), who applied the universal Akulin-Harel scheme to excited ions in Paul trap.

A significant part of QI-2007 was devoted to the critical analysis of the modern state of quantum theory, especially in the area of many particle ensembles. Andrei Khrennikov and Guillaume Adenier (Växjö University, Sweden) discussed fair sampling in EPR experiments that is the basis of quantum many-body theory. Detailed investigations of this kind of experiment are necessary because they reveal the stochastic character of quantum physics. It is also important to find new methods of representation of the quantum evolutions, more economical than the matrix algebra methods, because the latter require a huge amount of memory. Yuri Ozhigov (MSU, FTIAN) represented one of such methods: dynamical diffusion, which can serve as the satisfactory approximation for quantum unitary dynamics of the grain if spatial resolution is fixed. The concept of hidden time in quantum theory has been developed by Pavel Kurakin (MFTI). Al Kraklauer (USA) defended the positions of the so called local realism in quantum theory; his viewpoint represents the protest against the standard Hilbert formalism of tensor products that forms the base of the quantum theory of many bodies.

Indeed, Hilbert formalism leads us to and extremely large expenditure in time and memory if we try to simulate quantum evolution. But the excellent explanation of experimentally found entanglement makes us treat this formalism as the element that must be preserved in all possible reconsideration of the foundations of quantum theory.

The desirable reconsideration of the foundations of quantum theory could be heard in several papers presented at the QI-2007. My opinion is that the problem of quantum theory lies in its mathematical apparatus. It must be reorganized on the basis of algorithms instead of standard mathematics. An algorithmic approach in quantum physics is the best alternative to the standard formalism. This can be illustrated in the decoherence problem. The standard viewpoint treats decoherence as a kind of energy dissipation. The algorithmic treatment of decoherence represents it as the result of a severe limitation of classical memory in the simulation of quantum dynamics when the number of involved particles draws rapidly.

The very near future will show us the development of the ideas and methods represented at the QI-2007 symposium. Some video films from QI-2007 and books devoted to the algorithmic approach will soon become available at the site of the Quantum Informatics Chair in MSU: <http://qi.cs.msu.su/>
